Chapter I: Introduction

1.1 Background

Government of Bangladesh has a target to become a developed country by 2041. The development of energy and power infrastructure therefore is very important for the long-term economic development of the country. Draft Power System Master Plan (PSMP) 2016 is prepared in aiming at formulating a comprehensive energy and power development plan up to the year 2041, covering energy balance, power balance and tariff strategies. The new PSMP study has considered all the challenges and comes up with feasible and implementable proposals and action plans for Bangladesh.

Many of the power plants in Bangladesh cannot come to commercial operation within stipulated time due to many reasons. Moreover, some existing power plants cannot generate electricity as specified in terms of power, thermal efficiency etc. for each unit. As a result, shortage of power does not allow to stop facilities and to undertake periodical maintenance in a planned way. In order to secure an uninterrupted electricity supply, it is necessary to find out solutions to all of these issues and to establish a comprehensive institutional framework.

At this backdrop, Power Division decided to revisit the target of generation and transmission depicted in the PSMP 2016. Regional balances, fuel diversification, distribution infrastructure, demand side management, investment and generation cost issues will have to be addressed during examining the PSMP 2016.

1.1.1 Procedure Followed

The committee met in a number of formal meetings and had discussion with different sector entities and stakeholders to discuss and examine the targets and related data in order to ascertain demand to set a realistic target of power generation capacity. Future demand forecast and power generation plan from distribution and generation entities are considered in preparing the report. The report was presented in a workshop held on 25th February 2018. Advisor to the Hon’ble Prime Minister for Power, Energy and Mineral Resources was present in the workshop. Head of the Organizations, Companies, and representatives of the Independent Power Producers, Business Entities and Stakeholders were present in the workshop. Some relevant and substantive recommendations were made in the workshop which has been incorporated in the report.

The committee consulted with relevant persons, policymakers, experts and their opinion reflected in the report. The report was prepared based on the on-going plan in 2017. If this plan is updated it may change the scenarios of this report.

1.1.2 PSMP 2016

Draft PSMP 2016, aims at assisting Bangladesh in formulating an extensive energy and power development plan up to the year 2041. It covers energy balance, power balance, and tariff strategies. Bangladesh has a target to become an upper middle-income country by 2021 and high-income country by 2041. Since Bangladesh is facing the depletion of domestic gas supply, balance on

(Handwritten signatures and initials)

primary energy sources is to be reconsidered. In PSMP 2016, it is recommended that, meticulous analysis is required to find the best pathway to attain the sustainability of the energy and power sectors in balancing with the economic growth. So, Power Division has decided to further examine the generation targets and come up with best recommendations and action plans to implement.

1.1.3 Policy Vision of PSMP 2016

Government of Bangladesh has declared its intention to develop the country in order to become one of the developed countries by 2041 as the key goal of VISION 2041. To achieve the Vision, PSMP 2016 defines the intended goal and “five key viewpoints” mentioned below:

- Enhancement of imported energy infrastructure and its flexible operation
- Efficient development and utilization of domestic natural resources (gas and coal)
- Construction of a robust, high-quality power network
- Maximization of green energy and promotion of its introduction
- Improvement of human resources and mechanisms related to the stable supply of energy

1.1.4 Sustainable Development Goal (SDG)

At the seventieth session of the UN General Assembly on 25 September 2015, the member states have adopted the declaration ‘*transforming our world: the 2030 Agenda for Sustainable Development*’. In that declaration, 17 Goals with 169 Targets came into effect on 1 January 2016 and will guide the international development agenda over the next 15 years, i.e., up to 2030. The 7th goal of SDG is to ‘*Clean energy for everyone: Secure access to affordable, reliable, sustainable and modern energy for everyone.*’

For achieving goals of VISION 2041 and SDG, forecasting of power demand growth and sustainable generation plan is required. For that intention, present committee has examined demand forecast given by the distribution entities meticulously and come up with specific recommendations regarding power demand and generation planning. Therefore, power generation capacity is required to be increased with the growth of power demand proportionately. In addition, power transmission and distribution networks should be developed parallel to support the system.

Chapter II: Power Demand Forecast

2.1 Present Power Supply Situation

Maximum demand of Bangladesh in 2017 was about 9,000-9,500 MW (according to NLDC's report). According to PSMP-2016, in 2017, demands with and without Energy Efficiency and Conservation (EE&C) are about 10,300 MW and 10,600 MW respectively. So far, maximum generation is achieved 9,507 MW (including import) as on 18th October 2017. The demand is met by electricity generation from existing public and private power plants and import. However, demand for power is increasing in a rapid pace. Whether the growth rate of power demand is in accordance with the rate mentioned in the PSMP 2016, or more than that is the main issue which has been examined and depicted in this report.

2.2 Zone-wise Demand up to 2041 according to Distribution Utilities

According to the members of the committee, future demand projection will be more accurate if it is calculated based on demand forecast of distribution entities, as they know the nature of the growth of the number of consumers and their pattern of use. Distribution utilities have provided grid demand projection including a captive demand to the committee for the year 2017 to 2041 at 33 kV level as per their own Master Plan prepared based on the in-house study. The rate of demand growth from 2017 to 2041 at 33 kV level is forecasted to be as 14% - 5%. The loss of transmission 3.0% is considered for national grid demand at 132 kV. Forecasted demand growth rates are the same (14% to 5%) in national grid level for the same period. Year-wise demand and growth rates (national grid 132 kV level) are given in Table 1 and Figure 1. Zone wise demand and growth rate at 33 kV level from 2017 to 2041 are presented in Table 2 and Figure 2.

**Table 1 : Year-wise Demand including Captive Demand & Growth Rates
(National Grid 132 kV Level) from 2017 to 2041**

| Year | Demand (MW) | Growth rate (%) | Captive power to grid | Year | Demand (MW) | Growth rate (%) | Captive power to grid | Year | Demand (MW) | Growth rate (%) | Captive power to grid |
|------|-------------|-----------------|-----------------------|------|-------------|-----------------|-----------------------|------|-------------|-----------------|-----------------------|
| 2017 | 11,637 | | 300 | 2026 | 30,765 | 9 | 1,471 | 2035 | 59,275 | 7 | 1,967 |

Figure 2: Zone-wise Demand & Growth Rates (33 kV Level) from 2017 to 2041

2.3 Peak Power Demand Forecast as per GDP Elasticity Method

Peak demand for PSMP 2016 has been forecasted, with and without Energy Efficiency and Conservation (EE&C) by “GDP elasticity method”, which is an easier method than other methodologies. However, it has to be noted that this methodology disregards various factors, which may also have effect on the power demand; hence, the outcome may be significantly different from other methodologies. This report sets a target for energy efficiency to reduce the energy intensity of GDP by 15% by 2021 and by 20% by 2030. Nevertheless, this study sets a more simplified target of reducing the peak power demand by 20% from the BAU¹ case (GDP elasticity = 1.27) referring to Energy Efficiency & Conservation Master Plan (EECMP) and formulated the projection of peak power demand.

¹ Business as Usual

The comparison among high, base and low case peak demand forecast as per PSMP 2016 (without EE&C) is shown in Table 3. It is seen from Table 3 that, the maximum growth rate will be 10.2% in 2020 and gradually decreases.

Table 3: PSMP2016 Peak Demand' High, Base & Low case (Without EE&C measures)

| Year | Peak Demand (MW) [High Case] | G.R (%) | Peak Demand (MW) [Base Case] | G.R (%) | Peak Demand (MW) [Low Case] | G.R (%) |

| 2041 | 67,710 | 6.2 | 61,681 | 5.5 | 57,946 | 5.0 |

The comparison among high, base and low case peak demand forecast as per PSMP 2016 (with EE&C) is shown in Table 4. It is also seen from Table 4 that, the maximum growth rate will be 10.2% in 2020 and gradually decreases. The demand of high, base and low case (with EE&C) will be lower than high, base and low case demand of - without EE&C.

Table 4: PSMP2016 Peak Demand' High, Base & Low case (With EE&C measures)

| Year | Peak Demand (MW) [High Case] | G.R (%) | Peak Demand (MW) [Base Case] | G.R (%) | Peak Demand (MW) [Low Case] | G.R (%) | Effect of EE&C measures |
|------|------------------------------|---------|------------------------------|---------|-----------------------------|---------|-------------------------|

High, base and low case peak power demand have been forecasted based on collected data from distribution utilities. The comparisons between the peak power demand of high, base and low case without EE&C are shown in Table 5 and Figure 3. The low case demand growth rate will be significantly lower than high case demand.

Table 5: Forecasted Collected Demand High Case, Base Case & Low Case (Without EE&C)

| Year | Peak Demand (MW) [High Case] | G.R (%) | Peak Demand (MW) [Base Case] | G.R (%) | Peak Demand (MW) [Low Case] | G.R (%) |

Figure 4: Forecasted Collected Demand High Case, Base Case & Low Case (With EE&C)

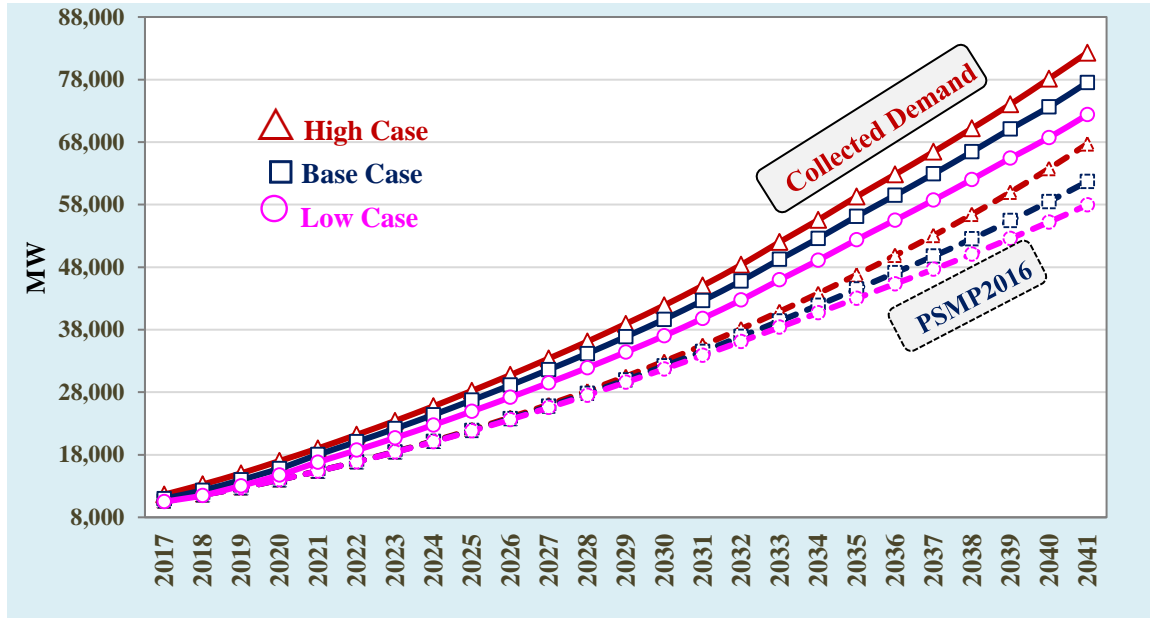

Handwritten signatures and initials at the bottom of the page.

The comparison between peak demand forecast as per collected data from distribution utilities and PSMP 2016 (without EE&C) is shown in Figure 5. The maximum growth rate of peak power demand collected from Utilities is higher in comparison to maximum growth rate of peak power demand in PSMP 2016.

Figure 5: Comparison between Collected Demand & PSMP 2016 Peak Demand (Without EE&C Measures)

The comparison between peak demand forecast as per collected data from distribution utilities and PSMP 2016 (with EE&C) is shown in Figure 6. The maximum growth rate of peak power demand collected from utilities is higher in comparison to maximum growth rate of peak power demand in PSMP 2016.

Figure 6: Comparison between Collected Demand & PSMP 2016 Peak Demand (With EE&C Measures)

2.4 Electricity for Economic Growth

Everybody knows that electricity use and access are strongly correlated with economic development of any country. There is an indication that reliability of electricity supply is important for economic growth. Effects of lack of availability of electricity can be a constraint to growth. In a report, on 'Electricity and Economic growth' by National Research Council, National Academy of Sciences, USA, it is mentioned that "Electricity use and gross national product have been, and probably will continue to be strongly correlated"². It is to be said that high economic growth proportionately increases electricity demand; on the other hand, availability of electricity has a direct influence on economic growth.

In a newspaper report, it is mentioned that, "Bangladesh has the potential to be among the fastest growing economies in coming years, which will help it take 28th place among the world's most powerful economies by 2030"². In another report, it is cited that "Bangladesh might be the 23rd largest economy of the world by 2050 with a gross domestic product (GDP) of \$3.064 trillion by purchasing power parity (PPP), says a report of global services giant PricewaterhouseCoopers (PwC)"³. However, without a supply of sufficient uninterrupted and quality electricity, this prediction will not come into reality. So, realistic prediction, planning, and implementation are essential to meet up the future requirement of electricity. The following important factors are affecting power demand.

2.5 Economic Development

In PSMP 2016, average 6% GDP growth up-to 2041 is considered. But in the financial year 2016-17 GDP growth was 7.1. In 7th 5-Year Plan it is expected that very soon GDP growth will grow up to 8%. This evidence indicates that, economic development is taking place faster than the prediction of PSMP 2016. So, it is clear that, growth of electricity demand will be more than the demand predicted in PSMP 2016.

2.6 Per Capita Income

According to PSMP 2016, per capita GDP will be US\$ 1,063 in the year 2020, US\$ 1,444 in the year 2025, US\$ 2,357 in the year 2035 and US\$ 2,970 in the year 2041 (at the price of 2005). According to the Bangladesh Bureau of Statistics (BBS), per capita income rose to \$1,610 in the FY 2016-17 from \$1,465 in the FY 2015-16. This rate is much higher than the rate predicted in PSMP 2016. So, it is clear that, if the per capita income increases in this pace, demand of electricity will be much more than the demand predicted in PSMP 2016.

³ <http://www.daily-sun.com/post/206533/Bangladesh-may-be-world%E2%80%99s-23rd-largest-economy-by-2050>

2.7 Industrialization

As land for agriculture is limited and there is almost no scope for generating more employment in this sector, so employment generation is greatly dependent on industrialization. There is no debate about the employment generation by industrialization is the most important way for the rapid economic development of the country. Electricity is the prime requirement for industrialization, more electricity required for rapid industrialization. In the financial year 2016-17, the contribution of Industries into GDP was 32.42%, which increases to 33.66% in the FY 2017-18⁴. According to PSMP 2016, contribution of Industries into GDP will be 37%. It is expected by the committee, that contribution of industries into GDP will be 40%; moreover size of the GDP will be much larger than that of present. So, much more electricity will be required, which should be considered during planning.

2.8 Population Growth

According to “World Population Prospects (WPP) 2015”, population of Bangladesh will be 202 Million in 2050. With growth of population, demand of electricity will increase proportionately, sometimes more than that. As the purchasing power is going up and percentage of poor and ultra-poor people is going down, demand of electricity will increase in rapid pace in comparison to population growth.

2.9 Some Other Factors Affecting Power Demand

Government has a target for turning the country into a developed country by 2041. To become a developed country, per capita GNI is required to be increased to at least US\$ 12,736, which is more than the income considered by PSMP 2016 team. So, the present committee considers that the demand of electricity will be more than the prediction of PSMP 2016, if the present rate of progress continues. This report based on the following factors, which are supposed to affect the demand of electricity:

- Reduction of poor and ultra-poor population
- Bringing new area into electricity coverage
- Increasing contribution of manufacturing industries into GDP
- Construction of new Economic Zones
- Setting up of heavy industries, e.g., Steel and Iron Industries
- Employment Generation and reduction of unemployment
- Increasing purchasing power of people
- Electrification of more irrigation pumps
- Urbanization of new areas and creation of satellite towns
- Vertical expansion of buildings
- Construction of new Shopping Complexes
- Introduction of Metro Rail
- Increasing numbers of Electric Vehicles

⁴ Bangladesh Bureau of Statistics (<http://www.bbs.gov.bd>)

- Increasing trend of using appliances which consumes more electricity (Fridge, AC, Oven, Induction Heater etc.)

2.10 According to Opinions of Distribution Entities

- 3-5 lacs new households are coming under electricity coverage every month. For these new connections, about 100 MW of electricity is being added to total demand.
- Old connection holders are purchasing new electrical appliances, for which additional 50 MW of electricity is being added to total demand.

However, there is no detailed and accurate study, the information and data about demand growth is given by the distribution entities might be very close to accuracy. These distribution offices or units are working at grass-root level; they know the consumption pattern of the consumers. It is also known to them about the number of households are waiting for electricity connection. There are some new township/satellite town projects are taken by RAJUK and other private companies, which will create additional demand for electricity. As a result huge amount of demand will be increased in upcoming few years.

2.11 GDP Growth Forecasted Through Collected Peak Demand & PSMP2016 Demand

The elasticity has been considered 1.27 (2017-2041) for calculating the GDP growth rate in this report. PSMP 2016 has also considered the elasticity to be 1.27 (2016-2041). GDP growth rate is calculated by electricity growth rate divided by elasticity. PSMP 2016 followed the same methodology in this regard.

To be an upper middle-income country by 2031, the economy of Bangladesh will require an average real GDP growth rate of 8.4 during 2018-2031. To be a high-income country by 2041, the economy of Bangladesh will require an average real GDP growth rate of 9.0% during 2021-2041 as per draft Macroeconomic Framework for the Perspective Plan of Bangladesh (2021-2041): Growth Outlook up to 2041. GDP growth rate is low at Macro Projections BAU scenario compared to Macro Projections Perspective Plan scenario. The comparison in this regard is shown in the following Table 7.

Table 7: Electricity & GDP Growth Rate through Collected Peak Demand case and PSMP2016 Peak Demand in high case (without EE&C measures)

| Year | Electricity and GDP growth rate (Demand collected from Utilities) in high case | | Electricity and GDP growth rate (PSMP 2016) in high case | | Macroeconomic Framework for the Perspective Plan of Bangladesh (2021-2041): Growth Outlook up to 2041 | |
|------|--|-------------|--|-------------|---|--------------------------------|
| | Electricity G.R (%) | GDP G.R (%) | Electricity G.R (%) | GDP G.R (%) | Macro Projections Perspective Plan scenario | Macro Projections BAU scenario |
| | | | | | GDP G.R (%) | GDP G.R (%) |
| 2017 | | | | | | |
| 2020 | 13 | 10 | 10 | 8.0 | 8 | 7.3 |
| 2021 | 12 | 9 | 10 | 7.8 | 8.1 | 7.3 |
| 2025 | 10 | 8 | 9 | 7.1 | 8.5 | 7.3 |
| 2026 | 9 | 7 | 9 | 6.9 | 8.6 | 7.3 |
| 2030 | 8 | 6 | 7 | 6.2 | 8.9 | 7.2 |
| 2031 | 8 | 6 | 7 | 6.1 | 9.0 | 7.1 |

(Handwritten signatures and initials)

| Year | Electricity and GDP growth rate (Demand collected from Utilities) in high case | | Electricity and GDP growth rate (PSMP 2016) in high case | | Macroeconomic Framework for the Perspective Plan of Bangladesh (2021-2041): Growth Outlook up to 2041 | |

Attachment 1

Zone-wise forecasted demand and growth rate of distribution utilities from 2017 to 2041 has been shown in Attachment 1

2.12 Estimating Daily Load Curve

The daily load curves are estimated during the 2017-2041 period. It is seen from Figure 7 that, in 2017 the maximum demand occurs in the evening time. However, in 2017-2041, maximum demand will be shifted gradually and the load curve would be like the load curve of developed countries. It has also been observed that, the maximum demand in the developed countries is found in the daytime.

Figure 7: Estimated Load Curves During the Period 2017-2041

According to the PGCB data, power demand reaches the highest level in April. Therefore, April is the highest and December is the lowest consumption month of power. The Max/Average/Min data will be standardized so that the Max value of demand in April will be 100%. There is assumed to be a proportionate increase or decrease in power demand on a time-of-day basis for the preparation of the daily load curve (2017-2041). The estimated monthly load curves for some specific years during the period 2017-2041 have been shown in Figure 8 and Figure 9.

2.13 Forecasted Energy Generation Demand & Load factor of High, Base and Low Case

Year-wise energy generation demand and load factor of high, base and low case have been forecasted based on calculated demand (without EE&C measures) which are shown in Table 8. It has also been observed that, energy generation demand and load factor will gradually increase during the period 2018-2041, which is shown in Figure 10.

Table 8: Forecasted Energy Generation Demand, Peak Demand and Load Factor

| Year | High Case | | | Base Case | | | Low Case | | |
|------|------------------|-----------------|---------------------------------|------------------|-----------------|---------------------------------|------------------|-----------------|---------------------------------|
| | Peak Demand (MW) | Load Factor (%) | Energy Generation Demand (MkWh) | Peak Demand (MW) | Load Factor (%) | Energy Generation Demand (MkWh) | Peak Demand (MW) | Load Factor (%) | Energy Generation Demand (MkWh) |

Handwritten signatures and initials at the bottom of the page.

2.14 Forecasted Energy Consumption Demand of High, Base and Low Case

Year-wise energy consumption demand of high, base and low case have been forecasted based on calculated energy generation demand (without EE&C measures) which are shown in Table 9. It has been observed that energy consumption demand of those cases will gradually increase during the period 2019-2041, which is shown in Figure 11. The transmission and distribution losses will gradually decrease during the period 2019-2041.

Table 9: Forecasted Energy Consumption Demand of High, Base & Low Case

Chapter III: Power Generation Planning for High Case Studies

3.1 New Generation Addition Plan to meet high case demand without EE&C measures

3.1.1 Utility-wise New Generation Capacity Addition (Committed Power Plants)

Year-wise new generation capacity addition is forecasted as per data collected from generation utilities which are presented in Table 11. It is found that, total new generation capacity addition from committed power plants from 2017 to 2041 will be 23,909 MW. Under this committed capacity of the plants, some of the projects are now under construction stage and some of the projects are now in the various stages of procurement process. Contract of these projects which are under procurement process will be signed in phase.

Table 11: Year-wise New Generation Capacity Addition (Committed Power Plants) from 2017 to 2041

3.1.2 Fuel-wise New Capacity Addition (Committed Power Plants)

Fuel-wise new generation capacity addition from 2017 to 2041 is forecasted as per the data collected from generation utilities which is presented in Table 12. It is found that, total new generation capacity addition from committed power plants from 2017 to 2041 will be 23,909 MW. Out of this capacity, nuclear-based generation capacity will be 2,232 MW and Gas/LNG based generation capacity will be 7,077 MW.

Table 12: Fuel-wise New Generation Capacity Addition (Committed Power Plants) from 2017 to 2041

3.1.3 New Generation Capacity Addition (Candidate Power Plants)

3.1.3.1 Year-wise New Generation Addition Plan

To meet up future demand and maintain optimum reserve margin, another 74,524 MW generation capacity addition will be required from candidate power plants starting from 2020. Under this candidate capacity of the plants, the projects are now in the various stages of planning process, not in the procurement or construction stage. These projects will go for procurement process in phases. Year-wise new generation capacity addition plan of candidate power plants from 2017 to 2041 is presented in the Table 13 and Figure 13.

Table 13: Year-wise New Generation Capacity Addition (Candidate Power Plants) from 2017 to 2041

| Year | Capacity addition (MW) | Year | Capacity addition (MW) | Year | Capacity addition (MW) |
|------|------------------------|------|------------------------|--------------|------------------------|
| 2017 | 0 | 2026 | 4,018 | 2035 | 5,052 |

Chapter IV: Power Generation Planning for Low Case Studies

4.1 New Generation Addition Plan to low case demand without EE&C measures

4.1.1 Utility-wise New Generation Capacity Addition (Committed Power Plants)

Year-wise new generation capacity addition is forecasted as per updated data collected from generation utilities which is presented in Table 15. It is found that, total new generation capacity addition from committed power plants from 2017 to 2041 will be 30,155 MW. Under this committed capacity of the plants, some of the projects are now under construction stage and some of the projects are now in the various stages of procurement process. Contract of these projects which are under procurement process will be signed in phase.

Attachment 3

List of Committed and Candidate Power Plants (2017-2041) has been shown in Attachment 3 for Low case studies.

Chapter V: Existing Generation Capacity for High & Low Case Demand

5.1 Net Generation Capacity of Existing Power Plants (2016 to 2041)

The total generation capacity from existing power plants was 12,282 MW in 2016. Fuel-wise net generation capacity is presented in Table 19 and Figure 14.

Table 19: Fuel-wise Net Generation Capacity of Existing Power Plants (2016)

| Fuel | Net Generation Capacity (MW) |
|--------------------|------------------------------|
| Gas/LNG | 7,576 |
| Liquid Fuel | 3,692 |
| Coal | 184 |
| Total | 11,452 |
| Hydro | 230 |
| Power Import | 600 |
| Grand Total | 12,282 |

Source: Revisiting Study Team

Figure 14: Fuel-wise Net Generation Capacity of Existing Power Plants (2016)

5.2 Existing Generation Capacity and Forecasted High case Demand

It appears that, generation capacity from existing power plants will decrease gradually and consequently widens the gap between generation capacity and demand. So, to meet up future demand and maintain sufficient reserve margin, new generation capacity addition will be required from committed and candidate power plants. Due to regular retirement of these power plants, this capacity will be decreased gradually and will stand at, only 830 MW in 2041. Existing generation capacity and forecasted high and low case demand (without EE&C) up to 2041 is shown in Figure 15 and Figure 16.

Handwritten signatures and initials at the bottom of the page.

5.3 What should be the Reserve Margin?

Reserve margin and reserve capacity of a power generation system is a measure of available capacity over and above the capacity needed to meet normal peak demand levels. Reserve margin is calculated by the formula:

$$\text{Reserve Margin} = \frac{(\text{Capacity}-\text{Demand})}{\text{Demand}};$$

Where, 'Capacity' is the expected maximum available supply and 'Demand' is expected peak demand.

Most of the countries usually maintain reserve margin 10-20% of maximum demand as insurance against breakdowns in part of the system or sudden increases in energy demand. Huge financial involvement requires for maintaining reserve margin in order to pay capacity and other fixed charges. It is true that for make the power supply smooth and healthy certain percentage of reserve margin is essential, but unplanned and aggressive increase in generation could make reserve margin more than optimum limit resulted into extra pressure in economy of the country. So, it is recommended for having a thorough study to ascertain which level of reserve margin is actually require for continuing uninterrupted and reliable power supply to the customers with minimum pressure on country's economy.

It must be kept in the mind that there should be at least 50% higher transmission facilities than total generation capacity with sufficient redundancy. Otherwise, the generation capacity as well as reserve margin will have of no use.

Chapter VI: Integrated Power Development Plan

6.1 Strategy for Preparation of Integrated Development Plan

In the PSMP 2016, it has been recommended to formulate an integrated power development plan and update this plan in a regular interval basis. Based on the recommendation and as per directive of Power Division, an integrated power development plan is prepared based on total net generation capacity, retirement; reserve margin and forecasted high and low case demand (without EE&C measures). Generation capacity from existing power plants will decrease gradually due to regular retirement of the power plants. So, to meet up future demand and keep sufficient reserve margin, new generation capacity addition is required from committed and candidate power plants.

Power sector utilities employ a simple strategy of maintaining reserve margin for ensuring system reliability, that means, always make more power available than requirement. But it is difficult to forecast future electricity demand accurately, moreover adding new generating capacity can take several years, so, adequate reserve margin may give comfort to the authority. The power sector regularly monitors the supply situation using reserve margin. National estimates of reserve margins are compared to pre-determined target levels to assess adequate power supply. But more reserve margin requires huge amount of investment for not only for constructing power plants, but also for paying capacity and other applicable charges. So, reserve margin should be determined through meticulous demand forecast and financial analysis. In the opinion of this committee, Reserve margin of power generation capacity should be more or less 20-25% higher than actual peak demand.

Loss of Load Expectation (LOLE) is a probabilistic measure that indicates the intimidation at which the generation capacity fails to meet the required power demand and its assessment involves specific parameters such as the plant generation capacity and outage rate of each generating unit.

6.2 Power Development Plan to meet high case demand (without EE&C measures)

Some feature of this plan is summarized below:

- The total net generation capacity of existing power plants is 11,946 MW in 2017, which is supposed to decrease to 830 MW only in 2041 that is shown in Figure 17. Total generation capacity of committed power plants is 1,827 MW in 2017 and 19,281 MW in 2041. However, total generation capacity of candidate power plants is projected to be 904 MW in 2020 and 74,049 MW in 2041. It is to be mentioned that some power plants will be retired from the system after expiry of the economic life of the plants.
- Considering generation capacity of existing, committed, candidate power plants and retirement, total net generation capacity in 2017 was 13,773 MW which is increasing gradually, it supposed to become 94,160 MW in 2041. An integrated power development plan is shown in Table 20.
- Gas/LNG based generation capacity is projected to be higher compared to coal-based capacity because LNG is clean fuel.

- Year-wise reserve margin is calculated considering year-wise net generation capacity of existing power plants, new generation capacity addition from committed and candidate power plants, retirement of power plants and forecasted peak demand of the same period. It may be mentioned here that if the growth of demand slows down due to any reason (such as recession or any other factor), reserve margin will be higher.
- Actual reserve margin is considered 18% in 2017. From 2028, reserve margin is supposed to be decreased gradually and will become 14% in 2041. During the period 2020-2028, the new capacity of the coal and nuclear-based power plants will be added to the system as a result, the reserve margin in this period will be high. The comparison between total demand, total net generation capacity and reserve margin is shown in Figure 17.
- If the value of LOLE is set at the standard value for developing countries of 1.0 to 1.5, the reserve margin theoretically appropriate for the current state is about 20-25. If international linkage and nuclear power generation are to be introduced in 2025, reliability of the power supply will be improved. A reserve margin of 8% and 15% will be required in order to attain the target of LOLE = 0.3, which will be very challenging target. As a result, it is assumed that the reserve margin shall be reduced from 25% in 2027 to the target of 12% by 2035 and shall be maintained up to 2041. The comparison between actual and targeted reserve margins are shown in Figure 18.

Table 20: Integrated Power Development Plan (2016 to 2041)-High Case Studies

Figure 18: Year-wise Actual and Targeted Reserve Margin (2017 to 2041)

6.3 Power Development Plan to meet low case demand (without EE&C measures)

- The total net generation capacity of existing power plants is 11,946 MW in 2017, which is supposed to decrease to 830 MW only in 2041 that is shown in Table 21. Total generation capacity of committed power plants is 1,419 MW in 2017 and 24,922 MW in 2041. However, total generation capacity of candidate power plants is projected to be 2,224 MW in 2022 and 53,755 MW in 2041. It is to be mentioned that some power plants will be retired from the system after expiry of the economic life of the plants.
- Considering generation capacity of existing, committed, candidate power plants and retirement, total net generation capacity in 2017 was 13,474 MW which is increasing gradually, it is supposed to become 79,507 MW in 2041. Gas/LNG based generation capacity is projected to be higher compared to coal-based capacity because LNG is clean fuel.
- Actual reserve margin is considered 28% in 2017. From 2026, reserve margin is supposed to be decreased gradually and will become 10% in 2041. During the period 2020-2028, the new capacity of the coal and nuclear-based power plants will be added to the system as a result, the reserve margin in this period will be high. It may be mentioned here that if the growth of demand slows down due to any reason (such as recession or any other factor), reserve margin will be higher. Year-wise net generation capacity, retirement, committed and candidate capacity and reserve margin are shown in Table 21 and Figure 19.
- If the value of LOLE is set at the standard value for developing countries of 1.0 to 1.5, the reserve margin theoretically appropriate for the current state is about 20-25%. If international linkage and nuclear power generation are to be introduced in 2025, reliability of the power supply will be improved. A reserve margin of 8% and 15% will be required in order to attain the target of LOLE

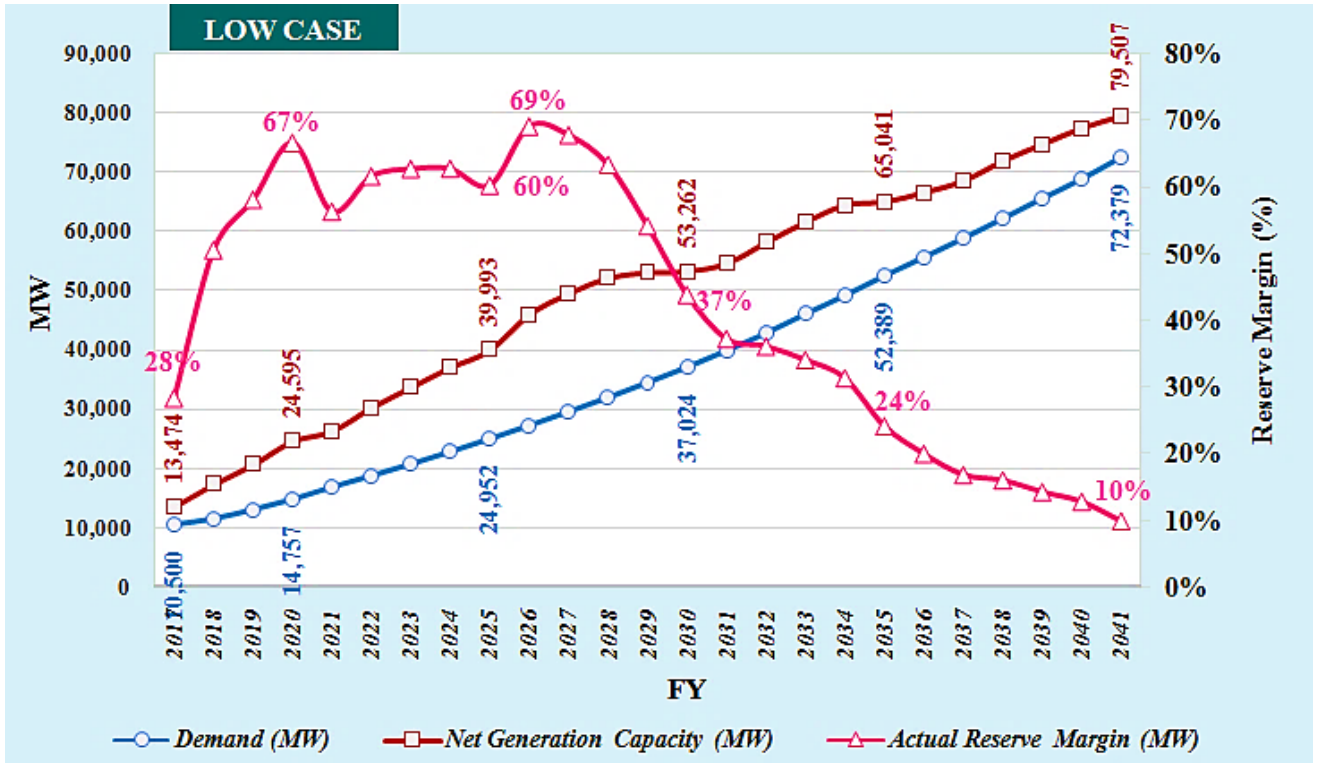

Figure 20: Year-wise Actual and Targeted Reserve Margin- Low Case (2017 to 2041)

6.4 Year-wise Fuel Mix in Total Net Power Generation Capacity

Handwritten signatures and initials at the bottom of the page.

Due to depleting gas reserve and future grim scenario of gas sector development, along with the problems of domestic coal development, the following factors are considered to prepare the fuel-based generation plan for the high and low case studies.

- Economic issues
- Environmental issues
- Constraint of transmission facilities
- Regional balance
- Fuel transportation
- Cost of generation

However, as it is recommended in PSMP 2016, the total amount of imported power in connection to the cross-border trade shall not exceed 15% of total generation capacity. It is also recommended that, power import through single connecting point to the fullest extent is economically efficient. However, if a huge amount of power is imported through one connecting point, it can lead to the risk of massive blackout, such as blackout across the entire country during the shutdown of the connecting line. In order to avoid this risk, the limit of the power loss level needs to be worked out, by checking sufficiently continuous power generators' operation during frequency drop and the load shedding scheme during large-scale power supply loss. Based on this result, the maximum level of import capacity in one inter-connection point has to be decided. It is strongly recommended that the amount of imported power through one connecting point is within 10% of the demand.

In order to maintain grid system stability of the power system, the above recommendation is applied in this study.

6.4.1 Year-wise Fuel Mix in Total Net Generation Capacity for High Case Studies

Based on the above issues, fuel wise forecasted generation capacity may be 94,100 MW which will require for meeting up demand of 82,292 MW in 2041. Out of this generation capacity, Gas/LNG based capacity will be higher compared to other fuels like coal, power import etc. in 2041. To meet the future demand, 2% power will be required from liquid fuel-based power plants and 15% from imported power of total net generation capacity in 2041. Considering demand forecast and issues mentioned above, year-wise fuel mix in power generation plan is shown in Table 22 and Figure 21.

Table 22: Year-wise Fuel Mix in Power Generation Plan-High Case Studies

6.4.2 Year-wise Fuel Mix in Total Net Generation Capacity-Low Case Studies

Based on the above discussion of the high case studies, fuel wise forecasted generation capacity may be 79,507 MW which will require for meeting up demand of 72,379 MW in 2041. Out of this generation capacity, Gas/LNG based capacity will be higher compared to other fuels like coal, power import etc. in 2041. To meet the future demand, 2% power will be required from liquid fuel-based power plants and 15% from imported power of total net generation capacity in 2041. Year-wise fuel mix in power generation plan is shown in Table 23 and Figure 22.

Handwritten signatures and initials at the bottom of the page.

6.5 Captive Power Generation Capacity

Handwritten signatures and marks at the bottom of the page.

According to data provided by BERC, the captive power generation capacity was 2,200 MW in 2017. Therefore, to meet up future demand and keep sufficient reserve margin, total generation capacity of captive power plants is projected to be around 2,500 MW in 2021 and about 5,900 MW in 2041. It is to be mentioned that the projection of the captive demand including on and off-grid will be 2,300 MW in 2021 and 5,400 MW in 2041. Out of the demand 30-35% will be shifted to national grid. The total captive generation capacity, demand and reserve margin are shown in Table 24.

Table 24: Captive Power Generation Capacity and Reserve Margin (2017-2041)

| Year | Demand (MW) (Off and On grid) | Generation Capacity (MW) | Reserve Margin (%) |
|------|----------------------------------|-----------------------------|--------------------|
| 2017 | 1,655 | 2,200 | 33 |

Chapter VII: Private Sector Investment in Generation Sector

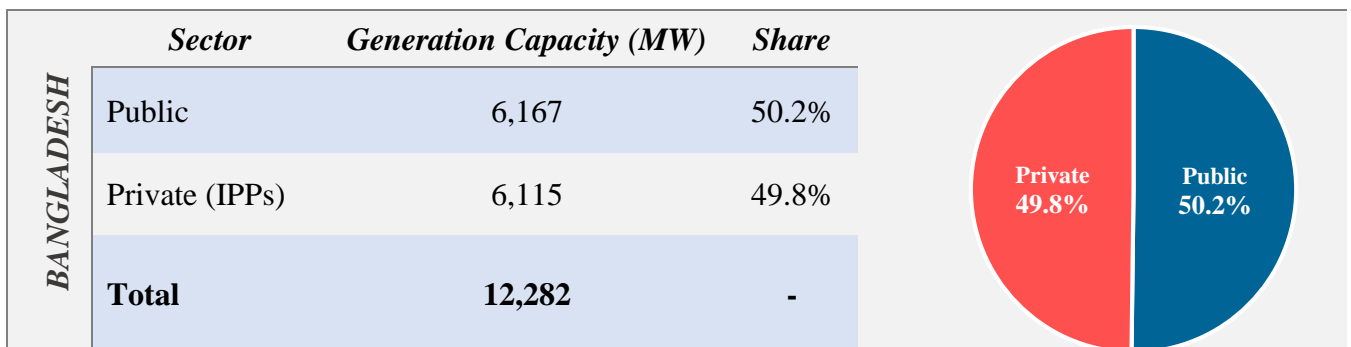

7.1 Introduction

The developing countries around the world are continuously trying to mobilize private investment to proficiently and quickly meet the rapid growth in electricity demand and to facilitate both the efficiency and quality of service. In developed countries, the prime objective of private sector investment in power generation is to keep downward trend in generation costs and associated prices, as well as enhancing efficiency through the capture of competitive market forces. The other purpose of the participation of private sector (IPPs) in the power generation is to reduce the burden of investment of governments and to promote the competitive environment, which could result in greater power sector efficiency and affordable prices for mass consumers.

A reasonable ratio of public and private sector generation may be fixed for ensuring healthy competition regarding price and efficiency between two sectors. Similarly, abnormal high dependence on IPPs may jeopardize the balance in power system. Both developing and developed countries, generally there are restrictions in share between public and private sector power generation capacity set by the regulatory bodies or governments to maintain balance.

7.1.1 Sector-wise Generation Capacity in Bangladesh

At present, in Bangladesh, there is no limiting line for the share of generation capacity by private sector. In 2017, the share of generation capacity in the private sector is approximately 50%, which tends to increase in a manner which may cross 50% in forthcoming years. Government may adopt essential measures to set a demarcation line for the public and private share of total generation capacity. The capacity share of public sector should be more than private sector to ensure the energy security of the country. The generation capacity share of public and private sector is shown in below.

The observations regarding public and private share of generation capacity of some neighboring countries are as follows:

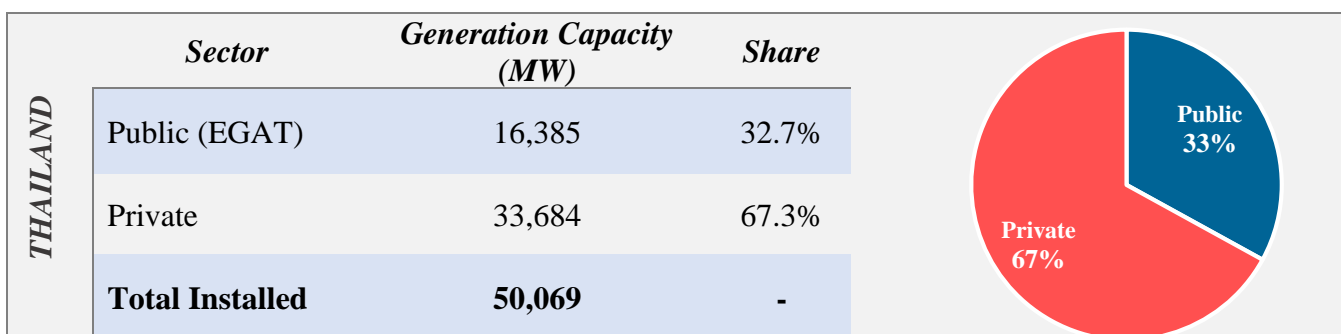

7.1.2 Sector-wise Generation Capacity in Sri-Lanka

In Sri-Lanka, Ceylon Electricity Board (CEB) and Private sector generate electricity and feed the national grid. Apart from generation, CEB is also the only buyer of electricity in the country; it purchases electricity from private power producers which are similar as power sector of Bangladesh. At present, over 62% of installed generation capacity in Sri Lanka is carried out by the public sector; rest power supplied by the private sector.

7.1.3 Sector-wise Generation Capacity in Thailand

The largest state-owned entity in the power sector is Electricity Generating Authority of Thailand (EGAT). EGAT is the key power generator and the sole operator of the national transmission network while the latter two are responsible for the distribution in provincial areas, and metropolitan areas and vicinity, respectively. Thailand has adopted the Enhanced Single Buyer (ESB) structure. The private sector participation has been allowed in Thailand since early 1990s when the government privatized the power generation business. The government liberalized the sector by introducing open bidding for power projects in 1994 under the Independent Power Producer (IPP) scheme to reduce EGAT's investment burden in building power plants to revitalize the fast growth. In addition to IPP, smaller-scale private-owned power plants operate under Small Power Producer or SPP (mostly 90 MW contracted capacity) and Very Small Power Producer (VSPP).

7.1.4 Sector-wise Generation Capacity in India

Indian power sector has 330.86 GW installed capacity with more than half i.e., 55.5% under State Electricity Boards, which is followed by Public Sector Unit's like NTPC, NHPC, and NPCIL etc. Over 55% of installed generation capacity in Sri Lanka is carried out by the public sector; rest is being carried out by the private sector.

Handwritten signatures and initials at the bottom of the page.

| INDIA | Sector | Generation Capacity (MW) | Share |
|-------|--------------------------|--------------------------|----------|
| | Public (Central & State) | 1,83,725 | 55.5% |
| | Private (IPPs) | 1,47,125 | 44.5% |
| | Total | 3,30,860 | - |

7.1.5 Shared Capacity of Public and Private Sector in Bangladesh

As per high case study, total generation capacity from public, private, import and candidate power plants will be 94,160 MW in 2041. Out of this capacity, public sector 61,882 MW (66%), private sector 4207 MW (4%), imported power 14,121 MW (15%) in 2041. In the long-term plan, the ownership of the candidate plants will not be possible to identify. So, the ownership of the total 13,950 MW capacity of the candidate plants will not be identified in this analysis. The sharing capacity of public and private sector up-to 2041 is shown in Table 25 and Figure 24.

Table 25: Shared Capacity of Public and Private Sector for High Case Studies

| Year | 2017 | 2020 | 2021 | 2025 | 2030 | 2035 | 2041 |
|---|--------|--------|--------|--------|--------|--------|--------|

Figure 24: Shared Generation Capacity of Public and Private Sector

7.1.6 Shared Capacity of Public and Private Sector Investment in Bangladesh

Handwritten signatures and initials at the bottom of the page.

A striking characteristic of private investment in electricity sector of the country has been the concentration of investments and projects in generation compared with transmission and distribution. So, transmission and distribution systems are still far behind in comparison to power generation. If similar situation continues for a long period, it will be difficult to get full benefit of increased generation. However, private investment is required in developing transmission and distribution systems parallels with generation. In fact, transmission capacity must be at least 50% higher than actual generation capacity. Similarly, distribution capacity should not be less than 100% higher than generation capacity.

7.1.7 Fair Competition between Public and Private Sector Initiatives

In power generation, there should be fair competition in public and private projects; so that, country and its people could get maximum benefit of less costly power as a derivative of fair competition. According to Private Sector Power Generation Policy of Bangladesh 1996, private entrepreneurs get Income Tax, VAT, any other surcharges and other benefits; which is not applicable for public sector agencies. Moreover, some IPPs have been permitted to import liquid fuel with some special condition, which is undoubtedly favorable to profitability of their projects. However, public sector power plants don't enjoy such facilities.

As per Public Procurement Act (PPA) 2006, public sector power plants are procured considering quality and cost-based tariff. It could be resulted to inefficiency in selecting EPC contractor and high implementation cost. So, in case of public sector power plants, tariff-based PPA should be introduced for bringing transparency and ensure fair competition with private plants.

Chapter VIII: Regional Balance

8.1 Zone-wise Total Net Generation Capacity & Demand for High Case Studies

Projection on power supply and demand balance by region for the years from 2017 to 2041 is presented in Table 26. From Table 26 it is found that, Dhaka and Chattogram are the highest and second highest in power demand. In 2017, Dhaka has net generation capacity of 4,940 MW corresponding to 4,149 MW demand and Chattogram has net generation capacity of 1,507 MW corresponding to 1,372 MW demand. In 2041, Dhaka has net generation capacity of 9,437 MW corresponding to 28,070 MW demand and Chattogram has net generation capacity of 21,888 MW corresponding to 10,844 MW demand.

8.1.1 Zone-wise Power Demand Supply Balance

From Table 26, it is observed that, in 2025, generation capacity in Dhaka region will be 10,078 MW but maximum demand will be 10,167 MW and there will be a total power shortage of 89 MW. In 2035, generation capacity in Dhaka region will be 10,292 MW but maximum demand will be 20,843 MW and there will be a total power shortage of 10,551 MW. However, in 2041, generation capacity in Dhaka region will be 9,437 MW but maximum demand will be 28,070 MW and there will be a total power shortage of 18,633 MW.

Moreover, there will also be shortages in Mymensingh and Rangpur region and other corresponding regions. However, Khulna region has many large-scale power resources, including DC interconnection from Bheramara, power from nuclear, Payra project, and others, with excess power in comparison to demand. In addition, Chattogram region is supposed to have large-scale power plants, including Matarbari and S. Alam, and then this area will be surplus in power. This excess power will be sent to Dhaka, Cumilla, and Rangpur and other zones to meet up the shortages in those areas. Therefore, it is very essential that, sufficient transmission capacity is to be planned and implemented in time.

More than 21,814 MW generation capacity is considered from the candidate plants to meet future demand, whose locations are not finalized yet. It is to be noted here that, usually power plants in different zones are constructed considering power demand of those zones, availability of fuel, power evacuation facilities etc. After generation electricity from power plants, electricity is first supplied to the national grid. Further, electricity is supplied from national grid according to requirement of zonal demand. The capacity of the candidate power plants (unknown location) required for mitigation of the zonal balance of power demand is shown in Table 27.

Attachment 4

Zone wise total Generation Capacity (existing, committed and candidate) and power demand at 33 kV level has been shown in Attachment 4 for high case Studies.

Table 26: Power Supply and Demand Balance by Region

| Year | 2018 | | | 2021 | | | 2025 | | |

**Chapter IX: Schedule Plan for Maintenance**

A tentative maintenance plan is prepared collecting data from generation utilities which is presented in Table 28. There are planning for overhauling, special maintenance as well as regular maintenance etc. It is recommended that a well-coordinated plan of schedule might be formulated for maintenance of the power plants, substations and transmission lines. Therefore, severe power crisis will not take place and regional demand might be fulfilled as much as possible.

Table 28: Utility-wise Maintenance Plan (2017 to 2041)

| Sl. No. | Name of Power Plant | Capacity (MW) | Type of Fuel | Maintenance timeline |
|--|---|---------------|--------------|---|
| Bangladesh Power Development Board (BPDB) | | | | |
| 1 | Tongi Gas Turbine overhauling | 105 | Gas | January, 2020 |
| 2 | Haripur GT (1 st Unit) overhauling | 32 | Gas | January to February, 2019 |
| 3 | Haripur GT (2 nd Unit) overhauling | 32 | Gas | March to May, 2019 |
| 4 | Chandpur CCPP (GT) overhauling | 106 | Gas | October to November, 2019 |

Chapter X: Renewable Energy

10.1 Renewable Energy Around in World

Sustainable Development Goal (SDG):7th goal of the SDG is ‘Ensure access to affordable, reliable, sustainable and modern energy for all.’ The global community has committed to achieve the SDG goals by 2030. In addition, population and economic growth will lead to the 30% more energy consumption in the world. India will take one fourth of total energy (Source IEA). Almost all energy consumption growth in coming decades is projected to be in developing countries. This energy consumption estimate already includes negative population growth in high-income countries and energy consumption decrease by energy efficiency and conservation measures.

Under these situations, renewable energy plays a significant role in achieving the projected energy consumption in world. International Energy Agency (IEA) estimates that the share of “modern renewable energy” (excluding traditional solid biomass) will increase from 14% to 19% in total energy demand in the world by 2040.

It also plays significant role in dropping global carbon emissions and the pace of investment has greatly enlarged as the cost of technologies goes down and efficiency continues to go up. Fossil fuels pose a threat to power generations and end users due to volatility of price and supply chain. The prices of renewable energy have been consistently decreasing⁵, with the most significant price go down being observed in solar – 80% over the last seven years. The prices for onshore wind are dropped by 25%, while offshore wind power starts to show the sign of decreased price in addition around the world. Renewable energy also provides security of supply, helping a nation to reduce its dependence on imported fuels. It plays a significant role in addressing our energy needs by replacing foreign energy imports with clean and reliable home-grown electricity with the added bonus of incredible local economic opportunities.

10.2 Government Policy

According to Bangladesh Renewable Energy Policy, 2008, it was fixed goal to achieve renewable energy share 5% of the total generation capacity (MW) by 2015, and 10% by 2020. Beyond 2020, Government intends to expand the 10% renewable energy target by 2041, although not predetermined in the existing policy.

⁵ The cost of renewable energy is now falling so fast that it should be a consistently cheaper source of electricity generation than traditional fossil fuels within just a few years, according to a new report from the International Renewable Energy Agency (IRENA).” Forbes, <https://www.forbes.com/sites/dominicdudley/2018/01/13/renewable-energy-cost-effective-fossil-fuels-2020/#315d15e34ff2>

10.2.1 Renewable Targeted Generation Capacity

Total generation capacity requirement will be about 94,000 MW to meet the demand 82,292 MW in 2041 for high case studies which is shown in Table 20. To meet the renewable energy policy target 10%, as per plan the renewable based capacity will be 9,400 MW by 2041 and 2,800 MW by 2021.

Total generation capacity requirement will be about 79,500 MW to meet the demand 72,000 MW in 2041 for low case studies which is shown in Table 21. To meet the renewable energy policy target 10%, as per plan the renewable based capacity will be 7,950 MW by 2041 and 2,600 MW by 2021.

In line with the targeted capacity, power sector utilities have taken initiatives to implement grid based renewable power generation projects. Under the initiatives some projects are in pipeline stage. Government is also giving incentives to private sector for implementing renewable based projects. NGOs could play a vital role to implement solar home systems (SHS) in rural areas. Achievements of renewable energy projects are shown below in Table 29.

Table 29: Achievements of Renewable Energy Projects

| Technology | Off-grid (MW) | On-grid (MW) | Total (MW) |
|------------------------|---------------|--------------|---------------|
| Solar | 286.72 | 39.1 | 325.82 |
| Wind | 2 | 0.90 | 2.90 |
| Biogas to Electricity | 0.68 | 0 | 0.68 |
| Biomass to Electricity | 0.40 | 0 | 0.40 |
| Total | 289.80 | 40 | 329.80 |

Source: SREDA, November 2018.

A year wise plan for power generation from renewable sources is prepared using the data collected from the generation utilities. Utility wise renewable energy-based generation plan is presented in Table 30 and fuel wise renewable energy-based generation plan is presented in Table 31.

Table 30: Utility-wise Renewable Energy based New Addition Generation Plan (2018 to 2041)

Attachment 5

Year-wise renewable energy generation plan (2017 to 2041) (detailed) has been shown in Attachment 5.

10.3 Integration of Renewable Energy into Power Development Plan

The peak power demand time in Bangladesh is at night, so the solar power does not work at peak time. Therefore, solar power is not considered in the integrated power development plan. If load pattern is changed from night peak today peak in future, solar power will be considered in the future power development plan.

10.3.1 Substantial Renewable Energy into Grid Connections

10.3.1.1 Variable Renewable Energy Grid Connections

The wind and sun are variable resources, meaning that their availability as an energy source fluctuates due to weather patterns. Power generation from wind and solar is fluctuating during whole day and night and if this power is fed to the grid, it affects the grid stability. IEA states that if the

(Handwritten signatures and marks)

fluctuating power from wind and solar is within 5-10% of the annual total grid connected power generation, then fluctuations are controllable by conventional power grid network⁶.

The forecasted potential of grid-connected power from solar and wind is to be 4,200 GWh/year (SREDA-World Bank, 2015). However, according to this study, the total forecasted energy generation from conventional resources will be around 1,00,000 GWh⁷ in 2020 and around 4,73,000 GWh⁶ in 2041.

Nevertheless, Bangladesh is still trying to develop its power generation, transmission and distribution network. Therefore, grid-connected utility-scale renewable power should be properly integrated into the power system development plan to ensure appropriate reserve margin and network capacity. Also, technical regulation or standard is required for grid-connected utility-scale renewable power. After these regulations and standards are promulgated, should be implemented, for ensuring grid stability.

10.4 Large Hydro via Cross-Border Power Trade

Bangladesh has a huge potential to exploit renewable energy beyond its boundary, i.e., regional hydropower potential in the South Asian countries. It is projected that Bangladesh can import about 5,000 MW hydro power mainly from Bhutan, Nepal and North-Eastern part of India around 2041⁸.

There are challenges to meet this target its domestic renewable resources. Nevertheless, if cross-border power import from hydro power generation is counted as hydropower, (around 4,000 MW from domestic renewable and 5,000 MW from cross-border hydropower) and easily may meet the policy target.

⁷ Estimated Energy for High Case

⁸ IEA, "The Power of Transformation - Wind, Sun and the Economics of Flexible Power Systems", 2014; PSMP 2016.

Chapter XI: Demand Side Management

11.1 Introduction

Demand Side Management (DSM) is applied to energy efficiency measures to reduce end-user's energy demand pattern. It has been applied to reduce the power demand as well as changes for all types of energy demand. The benefits of the end users are reduced their costs by adjusting the timing and amount of electricity use. The energy supplier can benefit from the shifting of energy consumption from peak to off-peak hours.

11.2 Why Encourage DSM?

Electricity is a flexible form of energy and critical resource for modern life and a vital infrastructural input for economic development. In all economies, households and industries have extensive demand for electricity. This demand is premeditated by such important factors as industrialization, extensive urbanization, population growth, rising standard of living and even the modernization of the agricultural sector.

Globally, electricity consumption is increasing speedily as new major economies develop in places such as India, Sri Lanka etc. This need for electricity drives a growing demand for electricity generation, with thousands of new power plants needed across the world over the coming decades. Every form of electricity generation has its strengths and limitation and future electricity generation will require a range of options, even though there must be low carbon emission if greenhouse gas emissions are to be reduced.

In line with this characteristic, the vision of Bangladesh Government is to turn Bangladesh into middle-income country by 2021 and developed country by 2041. Government is working to speed up power demand growth by setting up economic zones and industrial parks, increasing textile export etc. Consequently, a sustainable expansion plan has been prepared to provide the uninterrupted power supply for boosting up targeted economic growth in the country. Power generation capacity will be required to meet up the growing demand. Primary fuel and huge investment are required to generate the power. Climate change and global emission are one of the major threats in power generation. The demand of power has to increase to catch up required economic growth at a time one watt saved is one watt generated without burning of fossil fuel by DSM.

The advantages of DSM are shown in below:

- Cost reduction in customer energy bills;
- Environmental and socio-economic improvement: to reduced greenhouse gas emissions
- Reliability and network issues—increase system reliability
- Improved markets—short-term responses to electricity market conditions particularly by reducing load during periods of high market prices caused by reduced generation or network capacity.
- Reductions in the need for new power plant, transmission and distribution networks;
- Creation of long-term jobs due to new innovations and technologies;

- Increases in the competitiveness of local enterprises;
- Reduced dependency on foreign energy sources;

11.3 Methodology to Reduce the Demand

The main types of DSM activities may be classified in three categories:

- Energy reduction programmers: reducing demand through more efficient processes, buildings or equipment;
- Load management programmers: changing the load pattern and encouraging less demand at peak times and peak rates;
- Load growth and conservation programmers

The following measures should be taken to reduce the Power Demand:

The production of steam and hot water from boilers is a major activity for most enterprises and uses well known Technology. However, poor boiler operation represents a significant source of energy losses. Consequently, performance improvement of boiler is a realistic and low-cost option.

The measures that should be taken to improve the boiler performance include:

- Monitoring combustion conditions regularly and keeping efficiency as high as possible at all times;
- Ensuring adequate controls to adjust the quantity of combustion air;
- Ensuring insulation (on the outside of the boiler) and refractory (inside) are in good condition and that thicknesses are appropriate for good modern practice;
- The water treatment system should be in good working order at all times, and boiler feed water quality should be monitored regularly;
- Equipment should be checked frequently for steam and water leaks;
- Consider using flash steam in the plant;
- Fit automatic temperature controls to equipment wherever possible, to minimize waste of steam to overheat equipment or processes.
- Capacity utilization should be checked—one boiler operating at high load is much more efficient than two boilers each at low load.

The measures that should be taken to reduce power demand in lighting loads:

- Lighting system consumes more electricity as well as lighting normally offers good opportunities for savings. Use energy efficient fluorescent tubes, CFLs, LED and other low energy efficient light sources;
- Consider using energy efficient electronic ballasts;
- Clean luminaries regularly;
- Use appropriate lighting levels for different parts of the work area;
- Install lights at working level where possible, not necessarily on a high ceiling; Use natural light where possible, e.g. fit transparent roof panels or skylights;
- Paint walls and ceilings white or bright colors to improve light reflection.

The measures that should be taken to reduce power demand in motor loads:

- Motors and drive systems in all sectors: motors are significant energy consumers. Poor motor performance is typically a major source of energy losses. Use appropriately sized motors and only run when required;
- Use high efficiency motors;
- Use electronic variable speed controls where motor loads are variable in normal operation; Install improved bearings and lubricate frequently;
- Check power factor frequently and improve with capacitor banks, if possible installed close to the running equipment;

The measures that should be taken to reduce power demand in compressed air system:

Maintain all equipment regularly. Compressed air systems normally a significant user of electricity in an industrial plant, compressed air systems frequently lack meters and suffer poor maintenance. Operating practices may be poor too.

- Eliminate inappropriate use of compressed air (e.g. do not use for clearing away dust or metal shreds from lathes and similar machines);
- Listen for leaks during shift changes or lunch breaks, when workshops are typically quiet and not supposed to be using air;
- Regular maintenance of all parts of the system, including valves and joints, which are often subject to leaks. Check air filters as these may be blocked by dust or grease;
- Reduce air intake temperature e.g. consider relocating the intake;
- Improve overall system efficiency by checking compressor running times e.g. running when there is little or no demand;
- Optimize system pressure: do not generate at high pressure for tools etc. that do not need this; Install heat recovery systems.

The measures that should be taken to reduce power demand in electric appliances:

- Washing machines, dryers and dish washers—only run with a full load;
- Measures needing investment: Replace old inefficient appliances (washing machines, refrigerators, air-conditioners, etc.) with efficient ones;
- Replace electric water heater by solar water heater;
- Monitoring energy purchases and equipment procurement;
- Identifying energy saving opportunities;
- Developing projects to save energy, including technical and financial evaluations;
- Implementing projects and checking post-implementation performance.

The measures that should be taken to reduce power demand through public awareness:

- Maintaining employee communications and public relations. Measurement and verification of energy conservation measures;
- Appliance labeling, selected equipment and even buildings to indicate their expected energy consumption is a well-known and tested tool for raising customer awareness;
- Appliance labeling allows the consumer to compare appliances from various manufacturers and make an informed judgment when buying a new appliance.
- Educating energy consumers can contribute to reduce energy consumption by making them aware of the consumption levels.
- An “energy audit” is done to gather together all the relevant data and to analyze performance throughout the organization, from which deficiencies can be identified and recommendations for improvement made. Audits could be applied to industrial operations, commercial buildings, transport companies, and domestic premises.
- Develop a logical action plan to address the constraints, including specific recommendations and priorities for the different measures.

11.4 Tariff Incentives and Penalties

- Utilities encourage a certain pattern of use by tariff incentives where customers use energy at certain times to reap benefit of a better-priced rate. These include: Time-of-use (ToU) rates—where utilities have different charges for power use during different periods. Higher peak time charges would encourage a user to run high load activities in an off-peak period when rates are lower.
- Power factor charges, where users have to pay more for having power factors below a fixed threshold, usually 0.90 or 0.95. Real-time pricing, where the rate varies based on the utilities load (continuously or by the hour).

11.5 Information Dissemination

- Energy savings and energy efficiency activities depend on the combined efforts of SREDA and other distribution entities and individuals. Well-motivated and skilled personnel of relevant organizations are necessary to develop and implement energy efficiency policies which are essential for continued energy efficiency improvement activities.
- It is necessary to develop awareness through campaigns in order to inform the staff of energy-consuming organizations about energy efficiency options and specific DSM techniques. These campaigns may be marketed by personal contact and visual media, as well as carrying out energy audits, which also have benefits with respect to energy awareness.

11.6 Way Forward for Implementing DSM Programs

- There is generally a low awareness about energy efficiency and DSM programs; therefore, marketing is necessary to promote DSM.
- Load shifting could not be achieved by motivation only, so it is necessary to encourage customers to consume less electricity by revised tariff structure.
- Formulate regulation in order for facilitating the distribution utilities for investing in DSM programs.
- Many industrial and commercial companies still have not carried out energy audits to collect reliable information on their current equipment, machineries and operations. While this may be due to a failure by management to provide potential benefits of energy efficiency, some companies do not have skilled personnel to perform audits. Contemplation should be given to using outside experts, as the cost will normally be well accepted.
- Disseminate knowledge and understanding about DSM systems and opportunities.
- Demonstrate the competence and comprehensiveness of their assessment.
- Efficiency based incentives to be given.

Chapter XII: Present & Future Plan of Power Transmission System⁹

12.1 Status of Present Transmission System

Electricity generated in various power plants is being evacuated through 400 kV, 230 kV and 132 kV lines across the country. The existing transmission infrastructure includes 2 nos. of HVDC back-to-back station with 1000 MW capacity; 2 nos. of 400/230 kV substations with 2,210 MVA capacity; 1 no. of 400/132 kV substation with 650 MVA capacity; 24 (with two switching stations) nos. of 230/132 kV substation with 11,485 MVA capacity; 117 nos. of the 132/33 kV substations with 17886 MVA capacity, in total there are 144 substations with a total of 31,581 MVA capacity in whole transmission system. In addition, the total transmission line is approximately 10,623 Circuit kilometers; 400 kV transmission line 559.76 circuit kilometers, 230 kV transmission line 3,325 circuit kilometers and 132 kV transmission line 6,738 circuit kilometers. It is possible to dispatch about 16,097 megawatts of electricity through the transmission infrastructure.

12.2 Plan for future power transmission up to 2041

For comprehensive and sustainable solutions to limitation in power transmission capability, extensive development plans are being implemented for developing an efficient transmission system, which will be able to fulfill the requirement of transmitting generated power according to planning. Field work for developing necessary infrastructure is required for smooth transmission of electricity for the purpose of implementing “Electricity for all by 2021” programme. Transmission infrastructure development plan up to 2041 has been prepared considering draft PSMP 2016 and Revisiting PSMP 2016. Some salient features of the transmission infrastructure development plan are as follows:

12.3 Construction of 765 kV transmission line

Considering the current and future gas crisis, the emphasis has been given on construction of coal-based power plants. So, Matarbari, Moheshkhali and Payra are being developed as Power Hub, based mainly of coal fired power plants. Construction of 765 kV transmission line from Power Hubs to Load Center is guided in Draft PSMP-2016. According to guideline one double circuit 765 kV transmission line required to be constructed from Moheshkhali to Dhaka by 2024 and another double circuit 765 kV transmission line be constructed from Patuakhali to Dhaka by 2027.

⁹ Power Grid Company of Bangladesh (PGCB)

12.4 Construction of 765/400 kV transmission grid sub-station

To evacuate power from power plants from Matarbari, Moheskhali and Payra to major load centers in Dhaka, Chattogram area multiple 765/400 kV grid substations have been planned. The land acquisition process is already underway to build two 765/400 kV grid sub-stations named Bhulta and Dhaka (South) considering future demand of Dhaka city and its periphery. Besides, one 765/400 kV grid sub-station will be constructed near Mirsarai to provide electricity to Chattogram, Greater Cumilla and Greater Noakhali areas.

12.5 Construction of Cross-Border Transmission Links

To meet up the increasing demand of electricity resulting from socio-economic development and progress of the country, Government has taken steps to import power from neighboring countries through cross-border interconnections. Up to September 2018, 1,160 MW of electricity is being imported from India. There are also plan to import electricity from India, Nepal, Bhutan, Maldives and China in the future.

12.6 Construction of HVDC Back to Back Station

There are plans to build multiple HVDC Back to Back Stations for importing electricity through cross-border interconnection from neighboring countries. Alongside of existing Bheramara HVDC Back to Back Station there are plan to construct HVDC Back to Back station at Barapukuria, Cumilla, Jamalpur and Sylhet as well.

12.7 Construction of 400 kV high capacity Transmission ring around Dhaka city

At Present, about 40% of total generated electricity is consumed in Dhaka city. Electricity demand of Dhaka city is increasing more rapidly than other parts of the country. According to demand forecast of DPDC and DESCO, the electricity demand of Dhaka zone under these two utilities will be approximately 19,000 MW by 2041. There is a plan to construct 400 kV high capacity transmission ring around the Dhaka City area in order to ensure reliable quality power supply in DPDC & DESCO area.

12.8 Power Evacuation of Rooppur Nuclear Power Plant

According to the Government plan, two units of 2,400 (2×1,200) MW Rooppur nuclear power plant will come into operation by 2025-2026. For the safe and reliable evacuation of power from the nuclear power plant, construction of a transmission line is planned for construction having an N-2 contingency.

12.9 Providing uninterrupted power for the Economic zone:

Plan has been taken to supply uninterrupted powers to all economic zones are being implemented by Bangladesh Economic Zone (BEZA). With the increase of demand in Economic Zones, a plan has been taken to enhance power supply capacity to the economic zones according to requirement.

Meanwhile, high capacity transmission line and grid substation construction work is in progress in Mirsarai Economic Zone, which is the largest in Bangladesh.

12.10 Construction of 400 kV transmission lines for all regions

To make robust power transmission system, plan has been taken to build 400 kV transmission lines for all regions of the country. Each area of the country and Dhaka City will be connected with 400 kV transmission systems.

12.11 Comparison of Power Transmission Infrastructure

Integrated power transmission network plan has been prepared by PGCB in accordance with draft PSMP 2016 and Revisiting PSMP 2016. According to plan, ratio between transmission system dispatch capacity would be twice of projected peak demand which is shown in Table 32, Table 33 and Figure 25.

Table 32: Generation, Transmission and Distribution System up to 2041

| Year | Peak Demand Projection (GW) | | Integrated Power Generation Plan (GW) | Transmission Dispatch Capacity Plan (GW) |
|------|-----------------------------|-----------------------|---------------------------------------|--|
| | Draft PSMP-2016 | Revisiting Study Team | Revisiting Study Team | PGCB Capacity Plan |
| 2020 | 14.0 | 17.0 | 25.8 | 37.3 |
| 2025 | 21.9 | 28.2 | 43.1 | 67.2 |
| 2030 | 32.1 | 41.8 | 61.8 | 87.8 |
| 2035 | 44.4 | 59.2 | 73.5 | 107.8 |
| 2041 | 61.6 | 82.2 | 94.2 | 138.3 |

12.12 Year-wise Transmission Infrastructure up to 2041

According to the plan of 2041; the number of grid sub-stations will be 272 and the capacity will be 90,382 MVA by the year 2021 and 18,126 circuit kilometer transmission line at the same time. The number of grid sub-stations will be 344 and the capacity will be 1,36,986 MVA by 2025 and at the same time the transmission line will be 23,472 circuit kilometers; the total number of grid sub-stations will be 428 and the capacity will be 1,78,635 MVA. By the year 2030 and at the same time the transmission line will be 28,320 circuit kilometers; the number of grid sub-stations will be 506 and the capacity will be 2,14,236 MVA. By 2035 and the transmission line will be 32,436 circuits kilometer; the number of grid sub-stations will be 562 and the capacity will be 2,44,406 MVA By 2041, and at the same time the amount of transmission line is 36,870 circuits kilometers which are shown in Table 34, Figure 26, Figure 27 and Figure 28.

Table 34: Year-wise Total Transmission Infrastructure up to 2041

| Year | Substation | | | Transmission Line | |
|------|---------------|------------|-----------------|-------------------|------------------|
| | Voltage Level | Number | Capacity (MVA) | Voltage Level | Length (Ckt. km) |
| 2021 | 132/33 kV | 210 | 45,107 | 132 kV | 9,846 |
| | 230/132 kV | 52 | 35,085 | 230 kV | 5,086 |

Figure 28: Number of Grid Substations up to 2041

Chapter XIII: Regional Balance through Grid Network

13.1 Zone-wise Generation and Demand Balancing via Transmission Network

Transmission network plan is supposed to be developed considering future demand and generation plan. Bangladesh national grid is divided into two regions: Eastern Part and Western Part separated by the Ganges (Padma) –Brahmaputra (Jamuna) delta. Western and Eastern parts are also divided into two parts each: Southeast, Southwest, Northeast and Northwest. At present eastern and western parts are electrically connected via 230kV double circuit transmission lines.

Considering demand and generation gap among the zones, plan has been taken by PGCB to construct multiple 400 kV transmission lines. Some features of the future plans of PGCB are as follows:

- Each area will be connected with Dhaka with 400 kV (765 kV for some zones also) transmission system as centre point.
- Dhaka Centre point will be connected with Matarbari, Moheshkhali, Mirsarai Power Hub through 765kV transmission line.
- Rajshahi & Rangpur zones will be connected to Dhaka and Khulna through three 400kV transmission lines.
- Mymensingh and Sylhet will be connected with Dhaka through two 400 kV transmission lines.
- Khulna and Barishal will be connected to Dhaka through two 400kV and one 765kV transmission lines.
- Chattogram and Cumilla Zones will be connected to Dhaka through 400kV and 765kV transmission lines. This 400kV and 765kV will be connected with each zone and 230kV and 132kV network which will be the delivery of power to distribution utilities. In that case 765/400 kV,400/230kV, 400/132kV, 230/132kV and 132/33kV substation will be constructed in each zone as per requirement of the network.

Due to limitation of transmission capability among the zones/regions, liquid fuel-based power plants are being constructed in deficit areas, which is costly and detrimental to the environment. It is of utmost necessity to enhance grid connectivity among the zones/regions to get rid of such situation. It is recommended to build at least 150% higher transmission capacity than actual generation capacity in order to maintain smooth supply of power to the distribution entities. Grid lines and grid substations are required to be developed simultaneously and plan to be undertaken when it is being used over 60% load.

Redundancy in grid system is the existence of more than one means for performing transmission function. Redundancy plays an important role for reliability in power supply. In present transmission system, there are no enough redundancy. So, in case of cyclone and other natural calamities, power supply will be disrupted for even several days. So, adequate redundancy in power transmission system is recommended in order to avoid such situation.

There is one major incident of grid failure in Bangladesh on 01-11-2014 so enough protection system is required to be introduced as early as possible. Protection Systems are critical to establishing and maintaining an adequate level of grid reliability. The reliability standards required to be defined the level

of reliability to which PGCB must design, can be used to determine the performance requirements of electric system elements such as breakers, and Protection Systems. If required and recommended by the experts, islanding or isolation in addition to protection systems might be taken into consideration in order to avoid a countrywide blackout.

PGCB may open at least some of its grids and substations for private investment, to get rid of fund crisis, as well as create competitive environment between public and private grids. Private investment may bring momentum in constructing new grids and create instance in better grid management. So, it is recommended to formulate a 'Private Investment Policy in Grid Lines and Substations' as soon as possible.

NLDC is responsible for load dispatch and bring balance between generation and demand. In many countries, load dispatch centers are being operated as 'Independent System Operator'. In a meeting held in Power Division, Hon'ble Prime Minister passed order to convert the NLDC into ISO, but no substantive initiative has been taken by the PGCB in this regard. So, it is recommended to convert the NLDC as ISO in order to ensure transparency and improve accountability.

Chapter XIV: Future Planning in Distribution Sector

14.1 Distribution Lines

Geographical Information Systems (GIS) have become a standard and essential in planning and visualizing the structural information in distributed power networks. GIS is a valuable tool for not only mapping facilities but also to improve decision making and better management of infrastructure. The proper integration of GIS into a SCADA system allows for an easy, interactive exploration of spatial and process information of the entire utility’s network and inter-network information sharing at the same time. It is not enough to construct distribution lines only for ensuring quality power supply to the customers, which is the most important intention of the Power Division. Distribution utilities are implementing computer-based technologies to modernize their design, planning, maintenance and analysis applications in an un-integrated way. DMS (Distribution Management System), GIS (Geographical Information System) and SCADA (supervisory control and data acquisition) are appearing at an increasing rate in the language of the power distribution community. GIS integration with SCADA/DMS system requires a considerable investment in software development for system modernization and overcoming challenges.

Accessing GIS is necessary for improvement in reliability of supply through much quicker fault identification, isolation and restoration, which ultimately helps in better customers’ relation. Additional business improvements are possible with the real-time SCADA data available along with critical data maintained by GIS. At present, all generation, transmission and distribution entities work separately to have GIS and SCADA, it is important to integrate all systems together so that all entities could seek and get specific information from each other, then time and money will be saved. Overall operation, maintenance and support cost would be considerably reduced. Moreover, GIS and SCADA could play pivotal role in formulating future development plans and their implementation.

So, it is recommended to integrate all GIS and SCADA into a single system and exchange information in a coordinated way. Moreover, it is further recommended to establish Smart Grid, for which, GIS and SCADA are the foundation or building blocks in order to ensure uninterrupted and quality power supply to the customers, as well as reduce system loss, pilferage and wastage, which is very important for becoming a developed country. It is also recommended to convert whole power system to Smart Grid.

Requirement of distribution lines, substations and distribution transformers are forecasted based on the high case study. It has been seen that the distribution utilities formulate their future plans based on their own master plan, in-house need analysis and feasibility study. As per high case , future requirement of distribution lines, 33/11 kV substations and 11/0.4 kV distribution transformers are shown in the following tables Table 35, Table 36, Table 37, Table 38, Table 39 and Table 40.

Generally it is observed that in some areas power interruption take place frequently due to limitation of substation and distribution lines. When generation capacity is higher than actual demand, but in almost each case, generation side is blamed for deficit. Sometimes, due to sub-standard lines and overloaded substations, power supply disrupted during storms, cyclones, thunderstorms and even high wind. So, distribution entities are required to upgrade all lines and substations having adequate MVA. Actually they have to consider distribution sub-stations and lines overloaded when 60% of its capacity occupied and take project for up-gradation.

Chapter XV: Investment Requirement for Generation, Transmission & Distribution Facilities

15.1 Investment Requirement for High Case Studies

15.1.1 Investment Cost for New Generation Capacity Addition Plan

About US\$ 9.0 billion has already been invested during 2009 to 2016. Around 99,000 MW new capacity required to be added to meet the future power demand (2017-2041). Around US\$ 150 billion will be required to implement generation projects. Around US\$ 27 billion has already been ensured out of US\$ 150 billion. Year-wise investment requirements including nuclear power are shown in Table 41.

Table 41: Year-wise Investment Requirement for New Generation (2017-2041)

| Year | New Capacity Addition (MW) | Investment (US\$ in Billion) | Cumulative Investment Cost (US\$ in Billion) |
|--------------|----------------------------|------------------------------|--|
| 2017 | 1,827 | 1.5 | |
| 2018 | 4,691 | 4.2 | 5.7 |
| 2019 | 4,924 | 5.9 | 11.6 |
| 2020 | 3,721 | 4.5 | 16.1 |
| 2021 | 3,093 | 5.4 | 21.5 |
| 2022 | 5,881 | 5.0 | 26.5 |
| 2023 | 4,103 | 8.3 | 34.8 |
| 2024 | 5,132 | 9.9 | 44.7 |
| 2025 | 3,750 | 10.5 | 55.2 |
| 2026 | 5,134 | 13.9 | 69.1 |
| 2027 | 4,018 | 6.1 | 75.2 |
| 2028 | 4,438 | 6.7 | 81.9 |
| 2029 | 3,164 | 4.9 | 86.8 |
| 2030 | 4,343 | 6.4 | 93.2 |
| 2031 | 3,408 | 6.2 | 99.4 |
| 2032 | 2,120 | 3.4 | 102.8 |
| 2033 | 2,816 | 7.5 | 110.3 |
| 2034 | 2,646 | 7.4 | 117.7 |

15.1.2 Investment Cost for New Transmission Infrastructure

The aggregated investment requirement for development of transmission and related facilities is about US\$ 31 billion. The annual average investment requirement is about US\$ 1.28 billion. The highest investment requirement will be reached at US\$ 2.2-2.4 billion in 2021-2022. The year-wise investment requirements are shown in Table 42.

Table 42: Year-wise Investment Requirement for New Transmission Infrastructure up-to 2041

| Year | Investment Cost (US\$ in Billion) | Cumulative Investment Cost (US\$ in Billion) |
|--------------------|-----------------------------------|--|
| 2018 | 1.4 | |
| 2019 | 1.7 | 3.1 |
| 2020 | 2.0 | 5.1 |

(Handwritten signatures and initials)

15.1.3 Investment Cost for New Distribution Infrastructure

The aggregated investment requirement for development of distribution lines, substations and related facilities are found to be at US\$ 35 billion. The annual average of the investment requirement is about US\$ 1.46 billion. The highest investment will be required in 2018-2021 periods, which is about US\$ 1.8 - 1.9 billion. The year-wise requirement of investment is shown in the Table 43.

Table 43: Year-wise Investment Requirement for New Distribution Infrastructure (2017-2041)

| Year | Investment Cost (US\$ in Billion) | Cumulative Investment Cost (US\$ in Billion) |
|--------------------|-----------------------------------|--|
| 2018 | 1.9 | |
| 2019 | 1.8 | 3.8 |
| 2020 | 1.6 | 5.4 |
| 2021 | 1.4 | 6.8 |

15.2.2 Year-wise Total Investment Cost for Generation, Transmission and Distribution

Total investment requirement for generation, transmission and distribution facilities is estimated to be US\$ 193 billion by 2041. Out of this amount, investment requirement for the new generation will be US\$ 127 billion by 2041. The average investment required for each year will be about US\$ 8.0 billion. Total yearly investment requirements are shown in Table 47.

Table 47: Investment Requirement for New Generation, Transmission & Distribution (Low Case)
in billion US\$

| Year | Generation | Transmission | Distribution | Total |
|------------------------|--------------|--------------|--------------|------------|
| 2017-2025 | 47 | 13 | 12 | 72 |
| 2026-2030 | 31 | 5 | 7 | 43 |
| 2031-2035 | 26 | 6 | 7 | 39 |
| 2036-2041 | 24 | 6 | 9 | 39 |
| Total (2017-41) | 126.6 | 31 | 35 | 193 |

15.3 Projection Cost of Generation

15.3.1 Projection Cost of Fuel

The price of domestic gas in Bangladesh is much cheaper than the international price. However, this price is supposed to go up as LNG is being added into grid, which is much costly than domestic gas. In this study, the fuel cost is projected based on PSMP 2016: International cost of Crude Oil. It is to be mentioned that PSMP 2016 has also considered the same methodology to forecast the cost of fuel. The projection cost of fuel is shown in Figure 30 and Table 48.

Table 48: Year-wise Projection Cost of Fuel (2018-2041)

| Fuel Type | Unit | 2018 | 2019 | 2020 | 2021 | 2025 | 2030 | 2035 | 2041 |
|------------------------------------|-----------|------|------|------|------|------|------|------|------|
| Crude Oil Price (Brent basis+ IEA) | \$/BBL | 70 | 75 | 80 | 83 | 97 | 113 | 121 | 130 |
| Domestic Gas | \$/GJ | 8.0 | 8.6 | 9.1 | 9.5 | 11.0 | 12.9 | 13.8 | 14.8 |
| | \$/MMBTU | 8.4 | 9.0 | 9.6 | 10.0 | 11.6 | 13.6 | 14.5 | 15.6 |

15.3.3 Average Cost of Generation

The fuel cost, Fixed and Variable O&M cost are added into calculation of the average cost of generation which is shown in Figure 31. In this study, the average cost of generation per unit will increase from 7.28 Taka/kWh in 2018 to 8.20 Taka/kWh in 2041, which is nearly 13% above than 2018. It can be observed from Figure 31, the average generation cost will increase in 2019 due to increase the share of liquid fuel-based power generation, and it will be decreased after 2020 due to increase in the share of coal-based power generation.

In this analysis, projection of the cost of generation is made based on international economic prices of fuel, not on the domestic prices in Bangladesh. According to this analysis, the average cost of gas-based generation will be higher than that of coal, imported power and hydro-based generation, though it is still considerably lower than that of liquid fuel. The increased share of coal and imported power is supposed to contribute in reducing the average cost of generation.

Figure 31: Average Cost of Generation

Handwritten signatures and initials at the bottom of the page.

Chapter XVI: Conclusion

- In this study, it is found that, in 2017, the maximum demand was around 9,000-9,500 MW (according to NLDC), but according to the data provided by power distribution utilities for high case without EE&C measures, the maximum demand of power is 11,637 MW in 2017, 41,890 MW in 2030 and 82,292 MW in 2041.
- It is also found that for low case without EE & C measures, the maximum demand of power is 10,500 MW in 2017, 37,024 MW in 2030 and 72,379 MW in 2041.
- According to PSMP 2016, without EE&C measures for high case, the electricity demand in 2017 would be 10,600 MW which is expected to be increased to 32,945 MW in 2030 and 67,710 MW in 2041. However, without EE&C measures for low case, the electricity demand in 2017 would be 10,600 MW which is expected to be increased to 31,709 MW in 2030 and 57,946 MW in 2041.
- It is to be mentioned that demand diversity factor and energy efficiency conservation measures are not taken into consideration for this analysis of forecasting demand and preparing the Integrated Power Development Plan.
- The daily load curves are estimated for the 2017-2041 period. It has been seen from the daily load curve 2017; the maximum demand is occurred in the evening time. However, in 2017-2041, maximum demand will be shifted gradually and the load curve would be like the developed countries. It has also been observed that, the maximum demand in the developed countries is found in the daytime. Similarly, more than one peak hour in a single day might be seen in future, which happened in different countries as a consequence of massive industrialization.
- According to the PGCB data, power demand reaches the highest level in April. Therefore, April is the highest power consumption month and December is the lowest consumption month.
- Total generation capacity requirement will be about 94,000 against maximum demand about 82,300 in 2041 for the high case study. Generation capacity share of Gas/LNG based will be higher in comparison to coal-based capacity.
- Total generation capacity requirement will be about 79,507 against maximum demand about 72,379 in 2041 for the low case study. Generation capacity share of Gas/LNG based will be higher in comparison to coal-based capacity.

- Actual reserve margin is considered 28% in 2017. From 2026, reserve margin will decrease gradually and will become 10% in 2041 for the low case study.
- The target of power generation from renewable sources will be 2,800 MW by 2021 and 9,400 MW by 2041 for the high case study. As per the power generation plan from renewable sources according to the generation utilities 2,833 MW capacity will be added by 2041.
- The target of power generation from renewable sources will be 2,600 MW by 2021 and 7,900 MW by 2041 for the low case study. As per the power generation plan from renewable sources according to the generation utilities, 2,833 MW capacity will be added by 2041.
- Target has been set for developing transmission infrastructure to meet forecasted demand. According to the transmission planning target, dispatch capacity will be around double of demand at distribution end.
- According to the transmission plan, the dispatch capacity of 33 kV and 132 kV level would be 18,927 MVA (17,034 MW) in 2017. This capacity will be increased to 97,627 MVA (87,864 MW) in 2030 and 153,735 MVA (138,362 MW) in 2041.
- As per distribution plan, total distribution lines (33 KV and below) would be 476 thousand kilometer in 2020. This distribution lines will be increased to 660 thousand kilometer in 2030 and 783 thousand kilometer in 2041.
- As per the low case study, an investment will be required of US\$ 127 billion in generation, US\$ 31 billion in transmission and US\$ 35 billion in distribution sector by 2041.
- In this analysis, projection of the cost of generation is made based on international economic prices of fuel, not on the domestic prices in Bangladesh. So, the average per unit generation cost will be 7.63 Tk. /kWh in 2019 and 8.20 Tk/kWh in 2041.
- Now the actual generation cost is higher than bulk tariff. So, the proper price of generation cost is required. In this case, the adjustment of bulk tariff is important in each year.

Chapter XVII: Recommendation

- Considering GDP growth & demand diversity factor, low case scenario's forecasted power demand 72,000 MW and net generation capacity 79,500 MW should be logical for 2041.
- Power generation capacity enhancement should be in accordance with the increasing demand forecast.
- Reserve margin of generation capacity should be in between 20-25% higher than actual demand.
- Transmission and distribution infrastructure should be aligned with the increased generation.
- An investment requirement of US\$ 193 billion should be ensured for generation, transmission, and distribution by 2041.
- Distribution entities should build a required standard power distribution network.
- The merit order list of power plants/units is to be maintained and followed strictly unless an emergency occurs. One dedicated team to be formed with Single Buyer and PGCB personnel to supervise merit order dispatch periodically.
- Demand side management must be strengthened to control peak demand.
- The total share of imported power through CBET should not exceed 15% of total generation capacity. Import of power should commensurate with seasonal demand. Bangladesh may enter into regional electricity market to trade electricity.
- In order to maintain grid stability, import of power through a single point shall not exceed 10% of the instantaneous generation against demand.
- Public sector generation capacity shall be more than 50% of the total generation capacity.
- The surplus power in lean seasons may be exported to the neighboring countries maintaining the reserve margin.
- Generation capacity is needed to be balanced among the Eastern and Western region of the country followed by the requisite power demand of the concerned Zones/Regions/Areas until sufficient interconnectors and grids are constructed with adequate redundancy.
- Energy Efficiency and Conservation (EE&C) measures shall have to be taken into account for preparing the Integrated Power Development Plan.
- Power generation from renewable resources has to be increased to reduce the dependence on fossil fuel in order to conserve environment alining with the SDG's. Proportion of solar power

may be increased to the grid through different technologies and practices such as net metering system, inverter etc.

- Power transmission networks need to be interconnected into regional, national networks with multiple redundancies to reduce the risk of failure.
- PGCB shall have to develop and maintain the required reliable evacuation and transmission capacity to ensure the required power supply to the distribution entities.
- PGCB may open at least some grid lines and substations for private investment, to get rid of fund crisis, as well as create a competitive environment between public and private. Private investment may bring momentum in constructing transmission network & grid management.
- NLDC should be converted into ISO in order to ensure grid reliability, improve transparency and accountability.
- Co-ordination among generation, transmission and distribution utilities should be strengthened. Utilities should update themselves regularly in connection with the planning & implementation of expansion, up-gradation, and renovation of substations and lines.
- To ensure grid security and to avoid national blackout, the transmission network should have the capability to be separated into independent zone. Each zone should create load generation balance in order to maintain proper voltage, VAR and frequency.
- Integrate all GIS and SCADA into a single system and exchange information in a coordinated way as well as to convert the whole power system into Smart Grid.
- PSMP and PDP should be updated at least every alternate year or as and when required due to change in planning perspective.

List of Committed and Candidate Power Plants for High Case Studies (2017 to 2041)

Attachment-02

| Sl. No | Name of the Power Plant | Capacity (MW) | Net Capacity (MW) | Ownership | Type of Fuel | Expected Commissioning Date | Remarks |
|---|---|---------------|-------------------|-------------|--------------|------------------------------------|-------------------------------------|
| Projects Completion by Year 2017 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Shikalbaha 225 MW CCPP | 225 | 218 | BPDB | Gas/ HSD | Dec.,2017 | •Achieved: 86 % • GT under Test Run |
| 2 | Bheramara 360 MW CCPP | 410 | 410 | NWPGCL | Gas | SC:May, 2017 ST: Dec.,2017 | •Achieved: 94 % •Under Test Run |
| 3 | Ashugonj (North) CCPP | 360 | 360 | APSCL | Gas | June, 2017 | •Under Commercial Operation. |
| 4 | Chapai Nababganj 104 MW PP | 104 | 100 | BPDB | HFO | August, 2017 | •Under Commercial Operation. |
| 5 | Ghorasal 365 MW CCPP | 365 | 354 | BPDB | Gas | SC:August, 2017; ST: Dec, 2017 | •Achieved: 71 % •Under Test Run |
| Sub-Total (Public) | | 1,464 | 1,442 | | | | |
| Private Sector | | | | | | | |
| 1 | Bosila, Keranigonj 108 MW PP (CLC Power) | 108 | 108 | IPP | HFO | 22.02.2017 | •Under Commercial Operation. |
| 2 | Power import from Tripura | 60 | 60 | IPP | Import | August, 2017 | •Under Commercial Operation. |
| 3 | Kamalaghat 50 MW PP | 54 | 54 | IPP | HFO | October, 2017 | •Achieved: 75 % |
| 4 | Kusiarra 163 MW CCPP | 163 | 163 | IPP | Gas | October, 2017 | •Achieved:96 % •Under Test Run |
| Sub-Total (Private) | | 385 | 385 | | | | |
| Total (2017) | | 1,849 | 1,827 | | | | |
| Projects Completion by Year 2018 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Sirajgonj 225 MW CCPP (2 nd Unit) | 220 | 220 | NWPGCL | Gas/ HSD | SC:Sept., 2017 ST: June,2018 | •Achieved: 77 % |
| 2 | Siddirganj 335 MW CCPP | 335 | 335 | EGCB | Gas | SC:Janu, 2018 ST: June.,2018 | •Achieved: 92 % |
| 3 | Sirajgonj 225 MW CCPP (3rd Unit) | 220 | 220 | NWPGCL | Gas/ HSD | SC: March, 2018 ST: December, 2018 | •Achieved: 35 % |
| 4 | Bibiana #3 CCPP | 400 | 388 | BPDB | Gas | SC: March, 2018 ST: December, 2018 | •Achieved: 41 % |
| 5 | Barapukuria 275 MW (3rd Unit) | 274 | 252 | BPDB | Coal | June, 2018 | •Achieved: 70 % |
| 6 | Ashugonj 100 MW PP | 100 | 100 | APSCL | HFO | December, 2018 | |
| 7 | Gazipur 100 MW PP | 100 | 100 | RPCL | HFO | December, 2018 | • Contract Signed |
| 8 | Kodda 100 MW PP | 100 | 100 | BR Powergen | HFO | December, 2018 | |
| 9 | Horipur 100 MW PP | 100 | 100 | EGCB | HFO | December, 2018 | |
| 10 | Bagerhat 100 MW PP | 100 | 100 | NWPGCL | HFO | December, 2018 | |
| Sub-Total (Public) | | 1,949 | 1,915 | | | | |
| Private Sector | | | | | | | |
| 1 | Power import (2nd HVDC) | 500 | 500 | IPP | Import | July, 2018 | |
| 2 | Daodkandi 200 MW PP(Bangla Track) | 200 | 200 | IPP | HSD | March,2018 | • LOI Issued on 10.08.2017 |
| 3 | Noapara 100 MW PP (Bangla Track) | 100 | 100 | IPP | HSD | March,2018 | • LOI Issued on 10.08.2017 |
| 4 | Aorahati, Keranigonj 100 MW (Aggreko) | 100 | 100 | IPP | HSD | March,2018 | • LOI Issued on 10.08.2017 |
| 5 | Brahmangaon, Keranigonj 100 MW (Aggreko) | 100 | 100 | IPP | HSD | March,2018 | • LOI Issued on 10.08.2017 |
| 6 | Keranigonj 300 MW (APR) | 300 | 300 | IPP | HSD | March,2018 | • LOI Issued on 10.08.2017 |
| 7 | Bogura 113 MW PP (Confidence) | 113 | 113 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 8 | Ashugonj 150 MW PP (Midland) | 150 | 150 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 9 | Labonchora,Khulna 110 MW PP (Orion) | 110 | 110 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 10 | Kodda, Gazipur 300 MW PP (Summit) | 300 | 300 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 11 | Julda, Chattogram 100 MW PP (Accorn) | 100 | 100 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 12 | Chandpur 200 MW PP (Desh Energy) | 200 | 200 | IPP | HFO | July, 2018 | • LOI Issued on 10.08.2017 |
| 13 | Mymensingh 200 MW PP (United) | 200 | 200 | IPP | HFO | July, 2018 | |
| 14 | Potia, Chattogram 54 MW PP (Re-located from Satkhira) | 54 | 54 | IPP | HFO | December, 2018 | • LOI issued on 07.03.2017 |
| 15 | Gazipur 150 MW PP (Summit) | 149 | 149 | IPP | HFO | December, 2018 | •Contract Signed on 12.04.2017 |
| 16 | Julda, Chattogram 100 MW PP (Accorn Inf) (Unit-2) | 100 | 100 | IPP | HFO | December, 2018 | • Contract Signed |
| Sub-Total (Private) | | 2,776 | 2,776 | | | | |
| Total (2018) | | 4,725 | 4,691 | | | | |
| Projects Completion by Year 2019 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Khulna 330 MW CCPP (D/F) | 336 | 326 | BPDB | Gas/HSD | SC: March, 2019 ST: December, 2019 | •Contract Signed |
| 2 | Shajibazar 100 MW PP | 100 | 98 | BPDB | Gas | June, 2019 | • Tender Under Evaluation |
| 3 | Ghorasal 4th Unit Repowering | 200 | 398 | BPDB | Gas | May, 2019 | •Achieved: 31 % |
| 4 | Sylhet 150 MW PP Conversion | 75 | 218 | BPDB | Gas | June, 2019 | •NOA Issued |
| 5 | Mirsorai, Chattogram 150 MW PP | 150 | 150 | BR Powergen | Gas/HSD | December, 2019 | •Tender under evaluation |

List of Committed and Candidate Power Plants for High Case Studies (2017 to 2041)

Attachment-02

| Sl. No | Name of the Power Plant | Capacity (MW) | Net Capacity (MW) | Ownership | Type of Fuel | Expected Commissioning Date | Remarks |

| 9 | Jamalpur 100 MW Power Plant | 115 | 115 | IPP | HFO | June, 2019 | • Tender Under Evaluation |
| 10 | Anowara, Chattogram 300 MW PP (United Enterprise) | 300 | 300 | IPP | HFO | May, 2019 | • Contract Signed |
| 11 | Shikalbaha 110 MW PP (Kornofuly Power) | 110 | 110 | IPP | HFO | July, 2019 | • LOI issued on 20.08.2017 |
| 12 | Potiya, Chattogram 100 MW PP (Precision Energy) | 116 | 116 | IPP | HFO | October, 2019 | • LOI Issued on 18.04.2016 |
| 13 | Bhairab 50 MW PP | 54 | 54 | IPP | HFO | December, 2019 | • LOI issued on 20.03.2012 |
| 14 | Bhola 220 MW CCPP (D/F) (Shapoorji Pallonji) | 220 | 220 | IPP | Gas/ HSD | December, 2019 | • LOI Issued on 18.04.2016 |
| | Sub-Total (Private) | 2,116 | 2,116 | | | | |
| | Total (2019) | 4,503 | 4,924 | | | | |
| Projects Completion by Year 2020 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Sayedpur 150 MW PP | 150 | 146 | BPDB | HSD | January, 2020 | • Tender Document under preparation. |
| 2 | Bibiana South 383 MW CCPP | 383 | 372 | BPDB | Gas | SC: January, 2020 ST: December, 2020 | • Achieved: 17 % |
| 3 | Satkhira 25 MW PP | 25 | 25 | BPDB | HFO | June, 2020 | |
| 4 | Sreepur 150 MW HFO Based Power Plant | 150 | 150 | BR Powergen | HFO | December, 2020 | |
| | Sub-Total (Public) | 708 | 693 | | | | |
| Private Sector | | | | | | | |
| 1 | LNG based 750 MW CCPP (Reliance) | 718 | 718 | IPP | LNG | June, 2020 | • LOI Issued |
| 2 | Meghnaghat 500 MW CCPP (Summit) | 583 | 583 | IPP | LNG | December, 2020 | • Preliminary works |
| 3 | Import from Tripura (2nd Phase) | 340 | 340 | IPP | Import | December, 2020 | • Preliminary works |
| 4 | Chattogram 612 MW Coal Fired Power Project (S.Alam Group)-1 | 612 | 612 | IPP | Imp. Coal | December, 2020 | • Preliminary works |
| 5 | Chattogram 612 MW Coal Fired Power Project (S.Alam Group)-2 | 612 | 612 | IPP | Imp. Coal | December, 2020 | • Preliminary works |
| 6 | Fenchugonj 50 MW Power Plant | 55 | 55 | IPP/NRB | Gas | June, 2020 | • Approved by purchase committee. |
| 7 | Gabtolli 108 MW PP | 108 | 108 | IPP | HFO | December, 2020 | • Contract Signed |
| | Sub-Total (Private) | 3,028 | 3,028 | | | | |
| | Total (2020) | 3,736 | 3,721 | | | | |
| Projects Completion by Year 2021 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Ashugonj 400 MW CCPP (East) | 400 | 400 | APSCL | Gas | January,2021 | • Tender Under Evaluation |
| 2 | BIFPCL, Rampal, Coal Fired Power Plant | 1,320 | 1,214 | BIFPCL | Imp. Coal | March,2021 | • Contract Signed |
| 3 | Baghabari 100 MW PP Conversion | 50 | 146 | BPDB | Gas | June, 2021 | • Tender under evaluation. |
| 4 | Shajibazar 70 MW PP Conversion | 35 | 102 | BPDB | Gas | June, 2021 | • Tender under evaluation. |
| 5 | Mymensingh 360 MW CCPP | 360 | 360 | RPCL | Gas/HSD | June, 2021 | • Land acquisition & Development Completed |
| 6 | Barishal 225 MW CCPP (D/F) | 225 | 214 | BPDB | Gas/HSD | December, 2021 | • Preliminary works |
| 7 | Gazaria 350 MW Coal Fired Thermal Power Plant | 350 | 350 | RPCL | Imp. Coal | December, 2021 | • Land acquisition under process. |
| | Sub-Total (Public) | 2,740 | 2,786 | | | | |
| Private Sector | | | | | | | |
| 1 | Barishal 307 MW Coal Fired Power Plant | 307 | 307 | IPP | Imp. Coal | December, 2021 | • LOI Issued |
| | Sub-Total (Private) | 307 | 307 | | | | |
| | Total (2021) | 3,047 | 3,093 | | | | |

List of Committed and Candidate Power Plants for High Case Studies (2017 to 2041)

Attachment-02

| Sl. No | Name of the Power Plant | Capacity (MW) | Net Capacity (MW) | Ownership | Type of Fuel | Expected Commissioning Date | Remarks |
|---|--|---------------|-------------------|----------------|--------------|-----------------------------|--|
| Projects Completion by Year 2022 | | | | | | | |
| Public Sector | | | | | | | |
| 1 | Rupsa 800 MW CCPP | 800 | 800 | NWPGCL | LNG | January, 2022 | • Land acquisition under process. |
| 2 | Ghorasal 6 th Unit Repowering (Capacity Addition) | 206 | 388 | BPDB | Gas | June, 2022 | |
| 3 | Raozan 550 MW CCPP (1st Unit) | 550 | 530 | BPDB | LNG | June, 2022 | • PDPP under Preparation |
| 4 | Shiddirgonj 550 MW CCPP | 550 | 530 | BPDB | LNG | June, 2022 | • PDPP under Preparation |
| 5 | Bheramara 550 MW CCPP (D/F) | 550 | 530 | BPDB | Gas | December, 2022 | • PDPP under Preparation |
| 6 | Gazipur 450 MW CCPP | 450 | 450 | RPCL | LNG | December, 2022 | • Land acquisition Complete. |
| | Sub-Total (Public) | 3,106 | 3,228 | | | | |
| Private Sector | | | | | | | |
| 1 | Adani Power, Jharkhand, India | 1,496 | 1,496 | IPP | Import | June, 2022 | • LOI Issued on 31.05.2017 |
| 2 | Maowa, Munshiganj 522 MW Coal Fired Power Project (Orion) | 522 | 522 | IPP | Imp. Coal | June, 2022 | • Achieved:3 % |
| 3 | Dhaka 635 MW Coal Fired Power Project (Orion Group) | 635 | 635 | IPP | Imp. Coal | December, 2022 | • Contract Signed |
